This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

THE AUTHOR.

PREFACE.

THE very ample introduction, prefixed to the following collection of Mathematical Tables, has ſuperceded the neceſſity of uſing many words here by way of preface, and has left me little more to mention than the neceſſity and occaſion of this work, with ſome account of the contents and mode of execution.

The undertaking was occaſioned by the extreme incorrectneſs of the 5th, or laſt, edition of Sherwin's once very uſeful book of tables. Finding, as well from the report of others, as from my own experience, that that edition (to ſay nothing of the very improper alteration in the form of the table of ſines, tangents, and ſecants) was ſo very incorrectly printed, the errors being multiplied beyond all tolerable bounds, and no dependence to be placed on it for any thing of real practice, I was led to undertake the painful office of preparing a correct edition of another ſimilar work. And I was lucky enough to meet with a bookſeller of ſufficient ſpirit to be at the great expence of printing the book, as well as to allow me what I demanded for my trouble in preparing it; which demand however, was nothing adequate to the great labour attending it,

as I was well aware that the profits of the book would not afford him the means of rewarding my pains.

I have in the firſt place, therefore, uſed all the means in my power to render the work correct. I began by collating the 3d, or beſt edition of Sherwin's tables, with ſome others of the moſt perfect works of the ſame kind, as Briggs's, Vlacq's, Gardiner's quarto book, &c: by which means I detected many errors in each of them, which had not before been diſcovered; and of theſe between twenty and thirty were in the two editions of Gardiner's work, printed at London in 1742, and at Avignon in 1770; the errata of which two books are here printed at the end of our tables. But, beſides detecting many unknown errors in my copy of the ſaid 3d Edition of Sherwin, which was no more than what I expected, I diſcovered, with no ſmall ſurprize, that the laſt figures in the table of logarithms were not uniformly true to the neareſt unit, except in a very few pages at the beginning and end of the table; although Mr. Gardiner, the editor of that edition, had made the table correct in that reſpect in his own quarto work before-mentioned, which was alſo printed in the ſame year 1742 with the ſaid third edition of Sherwin! The errors from this cauſe amounted to ſeveral thouſands; and they have continued to run through all the editions of Sherwin ever ſince that time! But I have here corrected them. Nor have I employed leſs attention in correcting the preſs, than in previouſly correcting the copy; every proof having been ſeveral times read over, and compared with the beſt of the books before-mentioned.

But in giving this edition to the world, I was not ſatisfied with barely making it correct. I was aware that the materials themſelves might be much improved; and I have accordingly enlarged, or otherwiſe greatly amended them, in various reſpects. Among the improvements of the old materials, may be reckoned the following: namely, in the large table of logarithms, the proportional parts, near the beginning, are more conveniently arranged, being now all placed in the ſame opening of the book where their correſponding differences occur: The logarithms to ſixty one figures are brought to their proper place in the book, and more conveniently diſpoſed all in one page: The large table of ſines, tangents and ſecants, is more commodiouſly arranged, and rendered more diſtinct and convenient for uſe; the natural ſines, tangents, ſecants and verſed ſines, being all ſeparated from the others, and placed all together on the left-hand pages, and the logarithmic ones facing them on the right-hand pages; the common differences, in both, ſet between the two columns to which each of them anſwers; and the verſed ſines here introduced into their proper place in the ſame pages with the ſines, tangents and ſecants. Beſides theſe, there are ſome other alterations in the new tables here given, and the reader will find a number of very important improvements in the deſcription and uſe of the whole; eſpecially in the arithmetic of logarithms, and in the reſolution of plane and ſpherical triangles, according to the preſent improved methods

of calculation uſed by the Aſtronomer Royal, and other perſons the moſt experienced in theſe matters.

The improvements in the tables, by the introduction of new matter, are both great and numerous. The tables numbered 2, 3, and 4 are here added, being an entire new ſet, with their differences, for finding numbers and logarithms to twenty places. The columns of common differences, in the pages of natural ſines &c, are now firſt introduced: As are alſo the tables of hyperbolic and logiſtic logarithms; the logarithmic ſines and tangents for every ſecond, in the firſt two degrees of the quadrant; together with a table of the lengths of arcs; a table to change common and hyperbolic logarithms from the one to the other; &c: the uſes and exemplifications of the whole being very amply detailed.

But the greateſt alteration of all, is the very extenſive and new introduction here given, inſtead of the former inadequate and heterogeneous one, conſiſting of about 180 pages of new matter, on a methodical plan, containing the hiſtorical account and deſcription of all trigonometrical writings, and the tables relating to that ſubject, both natural and logarithmic; beſides the compleat uſe of our own tables. Inventions are here aſcribed to the proper authors, and their methods and improvements deſcribed and compared. This hiſtorical deſcription will evidently appear to be the reſult of immenſe labour and reading. And indeed I have

have painfully gone over all the books which are here ſo minutely deſcribed; and that deſcription with a detail in ſome degree adequate to their great merits; eſpecially the works of Napier, Briggs, Kepler, &c; which was the more neceſſary, as the writings and methods of thoſe great maſters had not been any where properly deſcribed and diſcriminated, although they are in themſelves highly curious and important.

Theſe readings and commentaries have been carried on to an extent far beyond what was at firſt intended. But the tables having been in the preſs for the ſpace of ſeven or eight years, I had thereby an opportunity of collecting and examining a ſtill greater number of books; ſo that I was gradually led on, and my views and plans rendered ſtill more extenſive and compleat. This delay, therefore, though in many reſpects it proved very inconvenient and diſagreeable, has at length given the occaſion of rendering theſe commentaries more perfect and ſatisfactory.

Beſides what immediately relates to trigonometrical ſubjects, the reader will here find many other curious and uncommon articles, relating to the ſeveral authors and their diſcoveries, which have occurred in the courſe of my reading, and which appeared of too much conſequence to be paſſed over unnoticed, in the analyſis of their ſeveral compoſitions. Among theſe is the diſcovery of the firſt author of the binomial theorem, and the differential method, which are due to Mr. Henry Briggs, whoſe

whoſe writings are replete with ingenious and original matter, and are well deſerving to be more generally known and ſtudied than they have been for ſome time paſt.

This long courſe of examination and deſcription, however, having been carried on for ſo many years, at different intervals, and interrupted by various avocations, and by buſineſs of different kinds, it will be no wonder if this circumſtance may have occaſioned ſome inequalities in the ſtile and compoſition of this hiſtory; and for which therefore, ſhould any ſuch appear, it is hoped the occaſion will plead an apology.

P. S. Since my Hiſtory of Trigonometrical tables, in the following introduction, was printed, there has been publiſhed, in the Philoſophical Tranſactions for the year 1784, a paper of mine concerning a project for the trigonometrical tables to be conſtructed on a new plan, namely, in which the arc of the quadrant is divided into aliquot parts of the radius, or according to the real lengths of the arcs. Which conſtruction is now in ſome degree of forwardneſs, as myſelf and ſeveral aſſiſtants have been cloſely engaged in the execution of it ever ſince.

INTRODUCTION.

I. OF TRIGONOMETRICAL TABLES, &c.

NECESSITY, the fruitful mother of moſt uſeful inventions, gave birth to the various numerical tables which compoſe the following work. Aſtronomy has been cultivated from the earlieſt ages. The progreſs of that ſcience, requiring numerous arithmetical computations of the ſides and angles of triangles, both plane and ſpherical, gave riſe to trigonometry; for thoſe frequent calculations ſuggeſted the neceſſity of performing them by the property of ſimilar triangles; and for the ready application of this property, it was neceſſary that certain lines deſcribed in and about circles, to a determinate radius, ſhould be computed, and diſpoſed in tables. Navigation, and the continually improving accuracy of aſtronomy, have alſo occaſioned as perpetual an increaſe in the accuracy and extent of thoſe tables. And this it is evident muſt ever be the caſe, the improvement of trigonometry uniformly following the improvement of thoſe other uſeful ſciences, for the ſake of which it is more eſpecially cultivated.

The ancients performed their trigonometry by means of the chords of arcs, which with the chords of their ſupplemental arcs, and the conſtant diameter, formed all ſpecies of right-angled triangles. Beginning with the radius, and the arc whoſe chord is equal to the radius, they divided them both into 60 equal parts, and eſtimated all other arcs and chords by thoſe parts, namely all arcs by 60ths of that arc, and all chords by 60ths of its chord or the radius: At leaſt this method is as old as the writings of Ptolemy, who uſed the ſexagenary arithmetic for this diviſion of chords and arcs, and for aſtronomical purpoſes.—And this by-the-bye ſhews the reaſon why the whole circumference is divided into 360, or 6 times 60, equal parts or degrees, the whole circumference being equal to 6 times the firſt arc whoſe chord is equal to the radius: Unleſs perhaps we are to ſeek for the diviſion of the circle in the number of days in the year; for thus, the ancient year conſiſting of 360 days, the ſun or earth in each day deſcribed the 360th part of the orbit; and thence might ariſe the method of dividing every circle into 360 parts; and, radius being equal to the chord of 60 of thoſe parts, the ſexageſimal diviſion both of the radius and of the parts might thence

ariſe. Trigonometry however muſt have been cultivated long before the time of Ptolemy; and indeed Theon, in his commentary on Ptolemy's Almageſt, l. 1. ch. 9, mentions a work of the philoſopher Hipparchus, written about a century and a half before Chriſt, conſiſting of 12 books on the chords of circular arcs; which muſt have been a treatiſe on trigonometry. And Menelaus alſo, in the firſt century of Chriſt, wrote 6 books concerning ſubtenſes or chords of arcs. He uſed the word *nadir* (of an arc), which he defined to be the right line ſubtending the double of the arc; ſo that his nadir of an arc, was the double of our ſine of the ſame arc; and therefore whatever he proves of the former, may be applied to the latter, ſubſtituting the double ſine for the nadir.

The radius has ſince been decimally divided; but the ſexageſimal diviſions of the arc have continued in uſe to this day. Indeed our countrymen Briggs and Gellibrand, having a general diſlike to all ſexageſimal diviſions, made an attempt at ſome reformation of this cuſtom, by dividing the degrees of the arcs, in their tables, into centeſms or hundredth parts, inſtead of minutes or 60th parts. The ſame was alſo recommended by Vieta and others; and a decimal diviſion of the whole quadrant might perhaps ſoon have followed, had it not been for the tables of Vlacq, which came out a little after, to every 10 ſeconds, or 6th part of a minute.—But the compleat reformation would be, to expreſs all arcs by their real lengths, namely in equal parts of the radius decimally divided: of which more in its proper place.

It is not to be doubted that many of the ancients wrote on the ſubject of trigonometry, as being a neceſſary part of aſtronomy; although few of their labours on that branch have come to our knowledge, and ſtill fewer of the writings themſelves have been handed down to us.

We are in poſſeſſion of the 3 books of Menelaus on ſpherical trigonometry; but the 6 books are loſt which he wrote on chords, being probably a treatiſe on the conſtruction of trigonometrical tables.

The trigonometry of Menelaus was much improved by Ptolemy (Claudius Ptolemæus) the celebrated philoſopher and mathematician. He was born at Peluſium, taught aſtronomy at Alexandria in Egypt, and died in the year of Chriſt 147, being the 78th year of his age. In the firſt book of his Almageſt, Ptolemy delivers a table of arcs and chords, with the method of conſtruction. This table contains 3 columns: in the 1ſt are the arcs to every half degree or 30 minutes; in the 2d are their chords, expreſſed in degrees, minutes and ſeconds, of which degrees the radius contains 60; and in the 3d column are the differences of the chords anſwering to 1 minute of the arcs, or the 30th part of the differences between the chords in the 2d column. In the conſtruction of this table, among others, Ptolemy ſhews, for the firſt time that we know of, this property of any quadrilateral inſcribed in a circle, namely that the rectangle under the two diagonals, is equal to the ſum of the two rectangles under the oppoſite ſides.

This method of computation, by the chords, continued in uſe till about the middle centuries after Chriſt; when it was changed for that of the ſines, which were about that time introduced into trigonometry by the Arabians, who in other reſpects much improved this ſcience, which

which they received from the Greeks, introducing, among other things, the three or four theorems, or axioms, which we uſe at preſent as the foundation of our modern trigonometry.

The other great improvements that have been made in this branch, are due to the Europeans. Theſe improvements they have gradually introduced ſince they received this ſcience from the Arabians. And although theſe latter people had long uſed the Indian or decimal ſcale of arithmetic, it does not appear that they varied from the Greek or ſexageſimal diviſion of the radius, by which the chords and ſines were expreſſed.

This alteration is ſaid to have been firſt made by George Purbach, who was ſo called from his being a native of a place of that name between Auſtria and Bavaria. He was born in 1423, ſtudied mathematics and aſtronomy at the univerſity of Vienna, where he was afterwards profeſſor of thoſe ſciences, though but for a ſhort time, the learned world quickly ſuffering a great loſs by his immature death, which happened in 1462, at the age of 39 years only. Purbach, beſides enriching trigonometry and aſtronomy with ſeveral new tables, theorems, and obſervations, ſuppoſed the radius to be divided into 600000 equal parts, and computed the ſines of the arcs, for every 10 minutes, in ſuch equal parts of the radius, by the decimal notation.

This project of Purbach was compleated by his diſciple, companion, and ſucceſſor John Muller, or Regiomontanus, who was ſo called from the place of his nativity, the little town of Mons Regius, or Koningberg in Franconia, where he was born in the year 1436. Regiomontanus not only extended the ſines to every minute, the radius being 600000, as deſigned by Purbach, but afterwards, diſliking that ſcheme, as evidently imperfect, he computed them likewiſe to the radius 1000000, for every minute of the quadrant. He alſo introduced the tangents into trigonometry, the canon of which he called *fœcundus* becauſe of the many and great advantages ariſing from them. Beſides theſe he enriched trigonometry with many theorems and precepts. Through the benefit of all theſe improvements, except for the uſe of logarithms, the trigonometry of Regiomontanus is but little inferior to that of our own time. His treatiſe, on both plane and ſpherical trigonometry, is in 5 books; it was written about the year 1464, and printed in folio at Nuremburg in 1533. And in the 5th book are various problems concerning rectilinear triangles, ſome of which are reſolved by means of algebra: a proof that this ſcience was not wholly unknown in Europe before the treatiſe of Lucas de Burgo. Regiomontanus died in 1476 at the age of 40 years only, being then at Rome, whither he had been invited by the Pope, to aſſiſt in the reformation of the calendar, and was ſuſpected to have been poiſoned there by the ſons of George Trebizonde, in revenge for the death of their father, which was ſaid to have been cauſed by the grief he felt on account of the criticiſms made by Regiomontanus on his tranſlation of Ptolemy's Almageſt.

Soon after this, ſeveral other mathematicians contributed to the improvement of trigonometry, by extending and enlarging the tables, though few of their works have been printed; and particularly John

Werner of Nuremburg, who was born in 1468 and died in 1528, and who is ſaid to have written five books on triangles.

About the year 1500, Nicholas Copernicus, the famous modern reſtorer of the true ſolar ſyſtem, wrote a brief treatiſe on trigonometry both plane and ſpherical, with the deſcription and conſtruction of the canon of chords, or their halves, nearly in the manner of Ptolemy; to which is ſubjoined a canon of ſines, with their differences, for every 10 minutes of the quadrant, to the radius 100000. This tract is inſerted in the firſt book of his *Revolutiones Orbium Cœleſtium*, firſt printed in folio at Nuremburg 1543. It is remarkable that he does not call theſe lines *ſines*, but *ſemiſſes ſubtenſarum*, namely of the double arcs.—Copernicus was born at Thorn in 1473, and died in 1543.

In 1553 was publiſhed the *Canon Fœcundus*, or table of tangents, of Eraſmus Reinhold, profeſſor of mathematics in the academy of Wurtemburg. He was born at Salfieldt in Upper Saxony, in the year 1511, and died in 1553.

To Franciſcus Maurolycus, abbot of Meſſina in Sicily, we owe the introduction of the *Tabula Benefica*, or canon of ſecants, which came out about the ſame time, or a little before. But Lanſbergius erroneouſly aſcribes this to Rheticus. And the tangents and ſecants are both aſcribed to Reinhold, by Briggs, in his *Mathematica ab antiquis minus cognita*, (pa. 30. Appendix to Ward's lives of the profeſſors of Greſham college.)

Francis Vieta was born in 1540 at Fontenai, or Fontenai-le-Comte, in Lower Poitou, a province of France. He was maſter of requeſts at Paris, where he died in 1603, being the 63d year of his age. Among other branches of learning in which he excelled, he was one of the moſt reſpectable mathematicians of the 16th century, or indeed of any age. His writings abound with marks of great originality, and the fineſt genius, as well as intenſe application. Among them are ſeveral pieces relating to trigonometry, which may be found in the collection of his works publiſhed at Leyden in 1646, by Francis Schooten, beſides another large and ſeparate volume in folio, publiſhed in the author's life time at Paris in 1579, containing trigonometrical tables with their conſtruction and uſe; very elegantly printed, by the king's mathematical printer, with beautiful types and rules, the differences of the ſines, tangents and ſecants, and ſome other parts, being printed with red ink, for the better diſtinction; but inaccurately executed, as he himſelf teſtifies in pa. 323 of his other works above-mentioned. The firſt part of this curious volume is intituled *Canon Mathematicus ſeu ad Triangula, cum Appendicibus*, and contains a great variety of tables uſeful in trigonometry. The firſt of theſe is what he more peculiarly calls *Canon Mathematicus, ſeu, ad Triangula*, which contains all the ſines, tangents, and ſecants for every minute of the quadrant, to the radius 100,000, with all their differences; and towards the end of the quadrant the tangents and ſecants are extended to 8 or 9 places of figures. They are arranged like our tables at preſent, increaſing on the left-hand ſide to 45 degrees, and then returning upwards by the right-hand ſide to 90 degrees; ſo that each number and its complement ſtand together on the ſame line. But here the canon of what we now call

tangents

tangents is denominated *fœcundus*, and that of the ſecants *fœcundiſſimus*. For the general idea prevailing in the form of theſe tables, is, not that the lines repreſented by the numbers are thoſe which are drawn in and about a circle, as ſines, tangents and ſecants, but the three ſides of right-angled triangles; this being the way in which thoſe lines had always been conſidered, and which ſtill continued for ſome time longer. And therefore he conſiders the canon as a ſeries of plane right-angled triangles, one ſide being conſtantly 100,000; or rather as three ſeries of ſuch triangles, for he makes a diſtinct ſeries for each of the three varieties, namely, according as the hypotenuſe or the baſe or the perpendicular is repreſented by the conſtant number 100,000, which is ſimilar to the radius, Making each ſide conſtantly 100,000, the other two ſides are computed to every magnitude of the acute angle at the baſe, from 1 minute up to 90 degrees or the whole quadrant. Each of the three ſeries therefore conſiſts of two parts, as repreſenting the two variable ſides of the triangle. When the hypotenuſe is made the conſtant number 100,000, the two variable ſides of the triangle are the perpendicular and baſe, or our ſine and coſine; when the baſe is 100,000, the perpendicular and hypotenuſe are the variable parts, forming the *canon fœcundus & fœcundiſſimus*, or our tangent and ſecant; and when the perpendicular is made the conſtant 100,000, the ſeries contains the variable baſe and hypotenuſe, or alſo *canon fœcundus & fœcundiſſimus*, or our cotangent and coſecant. Of courſe therefore the table conſiſts of 6 columns, 2 for each of the 3 ſeries, beſides the two columns on the right and left for minutes, from 0 to 60 in each degree.

The ſecond of theſe tables is ſimilar to the firſt, but all in rational numbers, conſiſting, like *it*, of 3 ſeries of 2 columns each, the radius, or conſtant ſide of the triangle, in each ſeries, being 100,000, as before, and the other two ſides *accurately* expreſſed in integers and rational vulgar fractions. So that we have here the canon of *accurate* ſines, tangents and ſecants, or a ſeries of about 4300 rational right-angled triangles. But then the ſeveral correſponding arcs of the quadrant, or angles of thoſe triangles, are not expreſſed. Inſtead of them are inſerted, in the firſt column next the margin, a ſeries of numbers decreaſing from the beginning to the end of the quadrant, which are called *numeri primi baſeos*. It is from theſe numbers that Vieta conſtructs the ſides of the 3 ſeries of right-angled triangles, one ſide in each ſeries being the conſtant number 100,000, as before. The theorems by which theſe ſeries of rational triangles are computed from the *numeri primi baſeos*, or marginal numbers, are inſerted all in one page at the end of this 2d table, and in the modern notation they may be briefly expreſſed thus. Let p be the primary or marginal number on any line, and r the conſtant radius or number 100,000; then if r denote the hypotenuſe of the right-angled triangle, the perpendicular and baſe, or the ſine and coſine, will be reſpectively

$$\frac{pr}{\frac{1}{4}p^2+1} \text{ and } r-\frac{2r}{\frac{1}{4}p^2+1}, \text{ (which laſt we may reduce to } \frac{\frac{1}{4}p^2-1}{\frac{1}{4}p^2+1}r);$$

when r denotes the baſe of the right-angled triangle, the perpendicular and

and hypotenuſe, or the tangent and ſecant, are expreſſed by

$$\frac{pr}{\frac{1}{4}p^2-1} \text{ and } r+\frac{2r}{\frac{1}{4}p^2-1}, \text{ (which laſt we may reduce to } \frac{\frac{1}{4}p^2+1}{\frac{1}{4}p^2-1}r),$$

and when r denotes the perpendicular of the right-angled triangle, the baſe and hypotenuſe, or the cotangent and coſecant, are then expreſſed by

$$\frac{1}{4}pr-\frac{r}{p} \text{ (or } \frac{\frac{1}{4}p^2-1}{p}r) \text{ and } \frac{1}{4}pr+\frac{r}{p} \text{ (or } \frac{\frac{1}{4}p^2+1}{p}r).$$

So that Vieta's general values will be as we have here collected them together in the following expreſſions immediately under the words ſine, coſine, &c; and juſt below Vieta's forms I have here placed the others to which they reduce and are equivalent, which are more contracted, but not ſo well adapted to the expeditious computation as Vieta's forms.

Sine	Coſine	Tangent	Secant	Cotangent	Coſecant
$\frac{pr}{\frac{1}{4}p^2+1}$ $\frac{p}{\frac{1}{4}p^2+1}r$	$r-\frac{2r}{\frac{1}{4}p^2+1}$ $\frac{\frac{1}{4}p^2-1}{\frac{1}{4}p^2+1}r$	$\frac{pr}{\frac{1}{4}p^2-1}$ $\frac{p}{\frac{1}{4}p^2-1}r$	$r+\frac{2r}{\frac{1}{4}p^2-1}$ $\frac{\frac{1}{4}p^2+1}{\frac{1}{4}p^2-1}r$	$\frac{1}{4}pr-\frac{r}{p}$ $\frac{\frac{1}{4}p^2-1}{p}r$	$\frac{1}{4}pr+\frac{r}{p}$ $\frac{\frac{1}{4}p^2+1}{p}r$

All theſe expreſſions it is evident are rational; and by aſſuming p of different values, from the firſt theorems Vieta computed the correſponding ſides of the triangles, and ſo expreſſed them all in integers and rational fractions.

To the foregoing principal tables are ſubjoined ſeveral other ſmaller tables, or ſhort ſpecimens of large ones: as, a table of the ſines, tangents and ſecants for every ſingle degree of the quadrant, with the correſponding lengths of the arcs, the radius being 100,000,000; another table of the ſines, tangents and ſecants, for each degree alſo, expreſſed in ſexageſimal parts of the radius as far as the 3d order of parts; alſo two other tables for the multiplication and reduction of ſexageſimal quantities.

The ſecond part of this volume is intituled *Univerſalium Inſpectionum ad Canonem Mathematicum Liber ſingularis.* It contains the conſtruction of the tables, a compendious treatiſe on plane and ſpherical trigonometry, with the application of them to a great variety of curious ſubjects in geometry and menſuration, treated in a very learned manner; as alſo many curious obſervations concerning the quadrature of the circle, the duplication of the cube, &c. Computations are here given of the ratio of the diameter of a circle to the circumference, and of the length of the ſine of 1 minute, both to many places of figures; by which he found that the ſine of 1 minute is between 2,908,881,959 and 2,908,882,056; alſo that, the diameter of a circle being 1000 &c, the perimeter of the inſcribed and circumſcribed polygon of 393216 ſides, will be as follows,

perim.

perim. of the inſcrib. polygon 314,159,265,35
perim. of the circum. polygon 314,159,265,37

and that therefore the circumference of the circle lies between thoſe two numbers.

Although no author's name appears to the volume I have been deſcribing, there can be no doubt of its being the performance of Vieta; for, beſides bearing evident marks of his maſterly hand, it is mentioned by himſelf in ſeveral parts of his other works collected by Schooten, and in the preface to thoſe works by Elzevir the printer of them; as alſo in M. Montucla's *Hiſtoire des Mathematiques*, which are the only notices I have ever ſeen or heard of concerning this book, the copies of which are ſo rare, that I never ſaw one beſides that which is in my own poſſeſſion, nor ever met with any other perſon at all acquainted with ſuch a book.

In the other works of Vieta, publiſhed at Leyden in 1646 by Schooten, as mentioned above, there are ſeveral other pieces relating to trigonometry, ſome of which, on account of their originality and importance, are very deſerving of particular notice in this place. And firſt, the very excellent theorems, here firſt of all given by our author, relating to angular ſections, the geometrical demonſtrations of which are ſupplied by that ingenious geometrician Alexander Anderſon, a native of Aberdeen. We find here theorems for the chords (and conſequently ſines) of the ſums and differences of arcs; and for the chords of arcs that are in arithmetical progreſſion, namely, that the firſt or leaſt chord is to the 2d, as any one after the firſt is to the ſum of the two next leſs and greater, for example as the 2d to the ſum of the 1ſt and 3d, and as the 3d to the ſum of the 2d and 4th, and as the 4th to the ſum of the 3d and 5th, &c; ſo that the 1ſt and 2d being given, all the reſt are found from them by one ſubtraction and one proportion for each, in which the 1ſt and 2d terms are conſtantly the ſame: next are given theorems for the chords of any multiples of a given arc or angle, as alſo the chords of their ſupplements to a ſemicircle, which are ſimilar to the ſines and coſines of the multiples of given angles; and the concluſions from them are expreſſed in this manner: 1ſt that if c be the chord of the ſupplement of a given arc a, to the radius 1, then the chords of the ſupplements of the multiple arcs, will be as in the annexed table: where the author obſerves that the ſigns are alternately + and —; that the vertical columns of numeral coefficients to the terms of the chords, are the ſeveral orders of figurate numbers, which he calls triangular, pyramidal, triangulo-triangular, triangulo-pyramidal, &c. *generated in the ordinary way by continual additions; not indeed from unity*, AS IN THE GENERATION OF POWERS, but beginning with the number 2; and that the powers obſerve always the ſame progreſſion: ſecondly, that if the chord of an arc a be called 1, and d the chord of the double arc $2a$, then the

&c.	&c.

the chords of the ſeries of multiple arcs, will be as in this table; where the author remarks as before on the law of the powers, ſigns, and coefficients, theſe being the orders of figurate numbers, raiſed from unity by continual additions, *after the manner of the geneſis of powers*, which generation in that way he ſpeaks of as a thing generally known, but without giving any hint how the coefficients of the terms of any power may be found from one another only, and independent of thoſe of any other power, as it was afterwards, and firſt of all I believe, done by Henry Briggs, about the year 1600: and 3dly, that if C be the chord of any arc a, to the radius 1, then the ſeries of the chords and ſupplemental chords of the multiple arcs, will be thus; where the values are alterately chords and chords of the ſupplements of the arcs on the ſame line, and the law of the powers and coefficients as before, but every alternate couplet of lines having their ſigns changed.

Another curious theorem is added to the above, for finding the ſum of all theſe chords drawn in a ſemicircle, from one end of the diameter to every point in the circumference, thoſe points dividing the circumference into any number of equal parts; namely as the leaſt chord is to the diameter, ſo is the ſum of the ſaid leaſt chord and diameter and greateſt chord, to double the ſum of all the chords including the diameter as one of them.

As the above theorems are chiefly adapted for the chords of multiple angles, a few problems and remarks are then added (whether by Vieta or Anderſon does not clearly appear, but I think by the latter) concerning the application of them, to the ſection of angles into ſubmultiples, and thence to the computation of the chords or ſines, or a canon of triangles. The general precept for the angular ſections is this; ſelect one of the above equations adapted to the proper number of the ſection, in which will be concerned the powers of the unknown or required quantity, as high as the index of the ſection; and from this equation find that quantity by the known methods for the reſolution of equations. Examples are given of three different ſections, namely for 3, 5, and 7 equal parts, the forms for which are reſpectively theſe

$$3C - C^3 \ldots\ldots\ldots = g$$
$$5C - 5C^3 + C^5 \ldots\ldots = g$$
$$7C - 14C^3 + C^5 - C^7 = g$$

where g is the chord of the given arc or angle, and C the required chord of the 3d, 5th, or 7th part of it. And it is ſhewn geometrically that the

the firſt of theſe equations has 2 real poſitive roots, the ſecond 3, and the laſt 4; alſo from the ſame principles the relations of theſe roots are pointed out.

The method then annexed for conſtructing the canon of ſines from the foregoing theorems, is thus: By dividing the radius in extreme-and-mean ratio, is obtained the ſine of 18 degrees; this quinquiſected, gives the ſine of 3° 36′: Again, by triſecting the arc of 60°, there is obtained the ſine of 20°; this again triſected gives that of 6° 40′; and this biſected gives that of 3° 20′: Then, by the theorem for the difference of two arcs, there will be found the ſine of 16′, the difference between 3° 36′ and 3° 20′: Laſtly, by four ſucceſſive biſections, will at length be found the ſines of 8′, 4′, 2′ and 1′. This laſt being found, the ſines of its multiples, and again of the multiples of theſe multiples, &c, throughout the quadrant, are to be taken by the proper theorems before laid down.

And the ſame ſubject is ſtill farther purſued and explained in the tract containing the anſwer given by *Vieta* to the problem propoſed to the whole world by Adrianus Romanus.

In the ſame collection of Vieta's works, from page 400 to 432, is given a compleat treatiſe on practical trigonometry, containing rules for reſolving all the caſes of plane and ſpherical triangles, by the *Canon Mathematicus*, or table of ſines, tangents and ſecants.

The next authors whoſe labours in this way have been printed, are Rheticus, Otho, and Pitiſcus: to all of whom we owe very great improvements in trigonometry.

George Joachim Rheticus, profeſſor of mathematics in the univerſity of Wurtemburg, and ſometime pupil to Copernicus, died in 1576, in the 60th year of his age. He conceived and executed the great deſign of computing the triangular canon for every 10 ſeconds of the quadrant, to the radius (10000000000000000) conſiſting of 1 followed by 15 ciphers. The ſeries of ſines which Rheticus computed to this radius, for every 10 ſeconds, and for every ſingle ſecond in the firſt and laſt degree of the quadrant, was publiſhed in folio at Francfort 1613 by Pitiſcus, who himſelf added a few of the firſt ſines computed to the radius 100000000000000000000000.

But the large work, or whole trigonometrical canon, computed by Rheticus, was publiſhed in 1596 by Valentine Otho, mathematician to the Electoral Prince Palatine. This vaſt work contains all the three ſeries for the whole canon of right-angled triangles (being ſimilar to the ſines, tangents and ſecants, by which names I ſhall call them), with all the differences of the numbers, to the radius 10000000000.

Prefixed to theſe tables are ſeveral books on their conſtruction and uſe in plane and ſpherical trigonometry, &c. Of theſe, the firſt 3 are by Rheticus himſelf; namely, book the 1ſt containing the demonſtrations of 9 lemmas concerning the properties of certain lines drawn in and about circles: the 2d book contains 10 propoſitions relative to the ſines and coſines of arcs, together with thoſe of their ſums and differences, their halves and doubles, &c. The 3d book teaches, in 13 propoſitions, the conſtruction of the canon to the radius 10000000000000000. By ſome of the common properties of geometry having determined the

ſines of a few principal arcs, as 30°, 36°, &c, in the firſt propoſition by continual biſections, he finds the ſines of various other arcs, down to 45 minutes. Then, in the 2d propoſition, by the theorems for the ſums and differences of arcs, he finds all the ſines and coſines, up to 90 degrees, in a ſeries of arcs differing by 1° 30′. And, in the 3d propoſition, by the continual addition of 45′, he obtains all the ſines and coſines in the ſeries whoſe common difference is 45′. In the 4th propoſition, beginning with 45′, and continually biſecting, he finds the ſines and coſines of the ſeries of half arcs till he arrives at the arc of $14^{viii}\ 19^{ix}$, the ſine of which is found to be 1, and its coſine 9999999999999. In the 5th propoſition are computed the ſine and coſine of 30″ or half a minute. In the 6th and 7th propoſitions are computed the ſines and coſines for every minute, from 1′ to 45′, as well as of many larger arcs. The 8th propoſition extends the computation for ſingle minutes much farther. In propoſition 9 and 10 are computed the tangents and ſecants for all arcs in the ſeries whoſe common difference is 45′; and theſe are deduced from the ſines of the ſame arcs by one proportion for each. In the remaining three propoſitions, 11, 12, 13, are computed the tangents and ſecants for ſeveral ſmall angles. And from all theſe primary ſines, tangents, and ſecants, the whole canon is deduced and compleated.

The remaining books in this work, are by the editor Otho; namely, a treatiſe, in one book, on right-angled plane triangles, the caſes of which are reſolved by the tables; then right-angled ſpherical trigonometry in four books; next oblique ſpherical trigonometry in five books; and laſtly ſeveral other books, containing various ſpherical problems.

Next after the above are placed the tables themſelves, containing, for every 10 ſeconds, the ſines, tangents and ſecants, with all the differences annexed to each, in a ſmaller character. The numbers however are not called ſines, tangents, and ſecants, but, like Vieta's before deſcribed, they are conſidered as repreſenting the ſides of right-angled triangles, and titled accordingly. They are alſo in like manner divided into three ſeries, namely, according as the radius, or conſtant ſide of the triangle, is made the hypotenuſe, or the greater leg, or the leſs leg of the triangle. When the hypotenuſe is made the conſtant radius 10000000000, the two columns of this caſe or ſeries, are called the perpendicular and baſe, which are our ſine and coſine; when the greater leg is the conſtant radius, the two columns of this ſeries are titled hypotenuſe and perpendicular, which are our ſecant and tangent; and when the leſs leg is conſtant, the two columns in this caſe are called hypotenuſe and baſe; which are our coſecant and cotangent. After this large canon is printed another ſmaller table, which is ſaid to be the two columns of the third ſeries, or coſecants and cotangents, with their differences, but to 3 places of figures leſs, or to the radius 10000000. But I cannot diſcover the reaſon for adding this leſs table, even if it were correct, which is very far from being the caſe, the numbers being uniformly erroneous, and different from the former through the greateſt part of the table.

Towards

Towards the close of the 16th century many persons wrote on the subject of trigonometry, and the construction of the triangular canon. But, their writings being seldom printed till many years afterwards, it is not easy to assign their order in respect of time. I shall therefore mention but a few of the principal authors, and that without pretending to any great precision on the score of chronological precedence.

In 1591 Philip Lansbergius first published his *Geometria Triangulorum* in four book, with the canon of sines, tangents, and secants; a brief but very elegant work; the whole being clearly explained: and it is perhaps the first set of tables titled with those words. The sines, tangents and secants of the arcs to 45 degrees, with those of their complements, are each placed in adjacent columns, in a very commodious manner, continued forwards and downwards to 45 degrees, and then returning backwards and upwards to 90 degrees: the radius is 10000000, and a specimen of the first page of the table is as follows:

o	Sinus		Tangens		Secants		
o	o	10000000	o	Infinitum.	10000000	Infinitum.	60
1	2909	9999999	2909	34377466738	10000000	34377468193	59
2	5818	9999998	5818	17188731915	10000002	17188734824	58
3	8727	9999996	8727	11459152994	10000004	11459157357	57
4	11636	9999993	11636	8594363048	10000007	8594368866	56
5	14544	9999989	14544	6875488693	10000011	6875495966	55
&c							&c.
							89

Of this work, the first book treats of the magnitude and relations of such lines as are considered in and about the circle, as the chords, sines, tangents, and secants. In the second book is delivered the construction of the trigonometrical canon, by means of the properties laid down in the first book: After which follows the canon itself. And in the third and fourth books is shewn the application of the table, in the resolution of plane and spherical triangles——Lansberg, who was born in Zealand 1561, was many years a minister of the gospel, and died at Middleburg in 1632.

The trigonometry of Bartholomew Pitiscus was first published at Francfort in the year 1599. This is a very compleat work; containing, besides the triangular canon, with its construction and use in resolving triangles, the application of trigonometry to problems of surveying, altimetry, architecture, geography, dialling, and astronomy. The construction of the canon is very clearly described: And, in the third edition of the book in the year 1612, he boasts to have added, in this part, arithmetical rules for finding the chords of the 3d, 5th, and other uneven parts of an arc, from the chord of that arc being given; saying that it had been heretofore thought impossible to give such rules: But, after all, those boasted methods are only the application of the double rule of False-Position to the then known rules for finding the chords of multiple arcs; namely, making the supposition of some

number for the required chord of a ſubmultiple of any given arc, then from this aſſumed number computing what will be the chord of its multiple arc, and which is to be compared with that of the given arc; then the ſame operation is performed with another ſuppoſition; and ſo on as in the double rule of poſition. The canon contains the ſine, tangent, and ſecant for every minute of the quadrant, in ſome parts to 7 places of figures, in others to 8; as alſo the differences for every 10 ſeconds. The ſines, tangents, and ſecants are alſo given for every 10 ſeconds in the firſt and laſt degree of the quadrant, for every 2 ſeconds in the firſt and laſt 10 minutes, and for every ſingle ſecond in the firſt and laſt minute. In this table the ſines, tangents and ſecants are continued downwards on the left-hand pages as far as to 45 degrees, and then returned upwards on the right-hand pages, ſo that the complements are always on the ſame line in the oppoſite or facing pages.

The mathematical works of Chriſtopher Clavius (a German jeſuit, who was born at Bamberg in 1537) in five large folio volumes, were printed at Moguntia, or Metz, in 1612, the year in which the author died, at the age of 75. In the firſt volume we find a very ample and circumſtantial treatiſe on trigonometry, with Regiomontanus's canon of ſines for every minute, as alſo canons of tangents and ſecants, each in a ſeparate table, to the radius 10000000, and in a form continued forwards all the way up to 90 degrees. The explanation of the conſtruction of the tables, is very compleat, and is chiefly extracted from Ptolemy, Purbach, and Regiomontanus. The ſines have the differences ſet down for each ſecond, that is, the quotients ariſing from the differences of the ſines divided by 60. About the year 1600 Ludolph van Collen, or à Ceulen, a reſpectable Dutch mathematician, wrote his book *de circulo & adſcriptis*, in which he treats fully and ably of the properties of lines drawn in and about the circle, and eſpecially of chords or ſubtenſes, with the conſtruction of the canon of ſines. The geometrical properties from which theſe lines are computed, are the ſame as thoſe uſed by former writers; but his mode of computing and expreſſing them, is different from theirs; for they actually extracted all the roots, &c, at every ſtep, or ſingle operation, in decimal numbers; but he retained the radical expreſſions to the laſt, making them however always as ſimple as poſſible: thus, for inſtance, he determines the ſides of the polygons of 4, 8, 16, 32, &c, ſides inſcribed in the circle whoſe radius is 1, to be as in the table annexed:

No. of ſides	Length of each ſide.
4	$\sqrt{2}$
8	$\sqrt{.2} - \sqrt{2}$
16	$\sqrt{.2} - \sqrt{.2} + \sqrt{2}$
32	$\sqrt{.2} - \sqrt{.2} + \sqrt{.2} - \sqrt{2}$
&c	&c.

where the point before any figure ($\sqrt{.2}$) ſignifies the root of all that follows it; ſo the laſt line is in our notation the ſame as $\sqrt{2-\sqrt{2+\sqrt{2-\sqrt{2}}}}$. And as the perfect management of ſuch ſurds was then not generally known, he added a very neat tract on that ſubject, to facilitate the computations. Theſe, together with other diſſertations on ſimilar geometrical matters, were tranſlated from the

the Dutch language into Latin by Willebrord Snell, and publiſhed at (Lugd. Batav.) Leyden in 1619. It was in this work that Ludolph determined the ratio of the diameter to the circumference of the circle to 36 figures, ſhewing that, if the diameter be 1, the circumference will be

greater than 3·14159,26535,89793,23846,26433,83279,50288,
but leſs than 3·14159,26535,89793,23846,26433,83279,50289;

which ratio was by his order, in imitation of Archimedes, engraven on his tomb-ſtone, as is witneſſed by the ſaid Snell, pa. 54, 55, *Cyclometricus*, publiſhed at Leyden two years after, in which he treats the ſame ſubject in a ſimilar manner, recomputing and verifying Ludolph's numbers. And in the ſame book he alſo gives a variety of geometrical approximations, or mechanical ſolutions, to determine very nearly the lengths of arcs, and the areas of ſectors and ſegments of circles.

Beſides the *Cyclometricus*, and another geometrical work (*Apollonius Batavus*) publiſhed in 1608, the ſame Snellius wrote alſo four others *doctrinæ triangularum canonicæ*, in which are contained the canon of ſecants, and in which the conſtruction of ſines, tangents and ſecants, together with the dimenſion or calculation of triangles, both plane and ſpherical, are briefly and clearly treated. After the author's death this work was publiſhed in 8vo, at Leyden 1627, by Martinus Hortenſius, who added to it a tract on ſurveying and ſpherical problems. Willebrord Snell was born in 1591 at Royen, and died in 1627, being only 35 years of age. He was profeſſor of mathematics in the univerſity of Leyden, as was alſo his father Rodolph Snell.

Alſo in 1627, Francis van Schooten publiſhed at Amſterdam, in a ſmall neat form, tables of ſines, tangents and ſecants for every minute of the quadrant, to 7 places of figures, the radius being 10000000; together with their uſe in the trigonometry of plane triangles. Theſe tables have a great character for their accuracy, being declared by the author to be without one ſingle error. This however muſt not be underſtood of the laſt figure of the numbers, which I find to be very often erroneous, ſometimes in exceſs and ſometimes in defect, by not being always ſet down to the neareſt unit. Schooten died in 1659, while the ſecond volume of his ſecond edition of Deſcartes' geometry was in the preſs. He was alſo author of ſeveral other valuable works in geometry and other branches of the mathematics.

The foregoing are the principal writers on the tables of ſines, tangents and ſecants, before the invention of logarithms, which happened about this time, namely, ſoon after the year 1600. Tables of the natural numbers were now all compleated, and the methods of computing them nearly perfected: And therefore, before entering on the diſcovery and conſtruction of logarithms, I ſhall ſtop here awhile to give a ſummary of the manner in which the ſaid natural ſines, tangents and ſecants were actually computed, after having been gradually improved from Hipparchus, Menelaus, and Ptolemy, who uſed only the chords, down to the beginning of the 17th century, when ſines, tangents, ſecants and verſed ſines were in uſe, and when the method hitherto employed had received its utmoſt improvement.

In

In this explanation I ſhall here firſt enumerate the theorems by which the calculations were made, and then deſcribe the application of them to the computation itſelf.

Theorem 1. The ſquare of the diameter of a circle, is equal to the ſum of the ſquares of the chord of an arc and of the chord of its ſupplement to a ſemicircle.

2. The rectangle under the two diagonals of any quadrilateral inſcribed in a circle, is equal to the ſum of the two rectangles under the oppoſite ſides.

3. The ſum of the ſquares of the ſine and coſine (hitherto called the ſine of the complement), is equal to the ſquare of the radius.

4. The difference between the ſines of two arcs that are equally diſtant from 60 degrees, or $\frac{1}{6}$ of the whole circumference, the one as much greater as the other is leſs, is equal to the ſine of half the difference of thoſe arcs, or of the difference between either arc and the ſaid arc of 60 degrees.

5. The ſum of the coſine and verſed ſine is equal to the radius.

6. The ſum of the ſquares of the ſine and verſed ſine, is equal to the ſquare of the chord, or to the ſquare of double the ſine of half the arc.

7. The ſine is a mean proportional between half the radius and the verſed ſine of double the arc.

8. A mean proportional between the verſed ſine and half the radius, is equal to the ſine of half the arc.

9. As radius is to the ſine, ſo is twice the coſine to the ſine of twice the arc.

10. As the chord of an arc is to the ſum of the chords of the ſingle and double arc, ſo is the difference of thoſe chords to the chord of thrice the arc.

11. As the chord of an arc is to the ſum of the chords of twice and thrice the arc, ſo is the difference of thoſe chords to the chord of five times the arcs.

12. And in general, as the chord of an arc is to the ſum of the chords of n times and $n + 1$ times the arc, ſo is the difference of thoſe chords to the chord of $2n + 1$ times the arc.

13. The ſine of the ſum of two arcs, is equal to the ſum of the products of the ſine of each multiplied by the coſine of the other and divided by the radius.

14. The ſine of the difference of two arcs, is equal to the difference of the ſaid two products divided by radius.

15. The coſine of the ſum of two arcs, is equal to the difference between the products of their ſines and of their coſines divided by radius.

16. The coſine of the difference of two arcs, is equal to the ſum of the ſaid products divided by radius.

17. A ſmall arc is equal to its chord or ſine, nearly.

18. As coſine is to ſine, ſo is radius to tangent.

19. Radius is a mean proportional between the tangent and cotangent.

20. Half

20. Half the difference between the tangent and cotangent or an arc, is equal to the tangent of the difference between the arc and its complement. Or, the ſum ariſing from the addition of double the tangent of an arc with the tangent of half its complement, is equal to the tangent of the ſum of that arc and the ſaid half complement.

21. The ſquare of the ſecant of an arc, is equal to the ſum of the ſquares of the radius and tangent.

22. Radius is a mean proportional between the ſecant and coſine. Or, as coſine is to radius, ſo is radius to ſecant.

23. Radius is a mean proportional between the ſine and coſecant.

24. The ſecant of an arc, is equal to the ſum of its tangent and the tangent of half its complement. Or, the ſecant of the difference between an arc and its complement, is equal to the tangent of the ſaid difference added to the tangent of the leſs arc.

25. The ſecant of an arc, is equal to the difference between the tangent of that arc and the tangent of the arc added to half its complement. Or, the ſecant of the difference between an arc and its complement, is equal to the difference between the tangent of the ſaid difference and the tangent of the greater arc.

From ſome of theſe 25 theorems, extracted from the writers before mentioned, and a few propoſitions of Euclid's elements, they compiled the whole table of ſines, tangents, and ſecants, nearly in the following manner.

By the elements were computed the ſides of a few of the regular figures inſcribed in a circle, which were the chords of ſuch parts of the whole circumference as are expreſſed by the number of ſides, and therefore the halves of thoſe chords the ſines of the halves of the arcs. So, if the radius be 10000000, the ſides of the following figures will give the annexed chords and ſines.

The figure	Arcs ſub-tended	Its chord, or ſide	Half arc	Its ſines, or ½ chord
Triangle	120°	17320508	60°	8660254
Square	90	14142136	45	7071068
Pentagon	72	11755705	36	5877853
Hexagon	60	10000000	30	5000000
Decagon	36	6180340	18	3090170
Quindecagon	24	4158234	12	2079117

Of ſome, or all of theſe, the ſines of the halves were continually taken, by theorem the 6th, 7th, or 8th, and of their complements by the 3d; then the ſines of the halves of theſe, and of their complements, by the ſame theorems; and ſo on alternately of the halves and complements, till we arrive at an arc which is nearly equal to its ſine. Thus, beginning with the above arc of 12 degrees, and its ſine, we obtain the halves as follows;

The

The ſines of ſmall arcs are then deduced in this manner. From the ſine of 45′ above determined, are found the halves, which will be thus:

45′	0″	. . . . .	130896
22	30	. . . . .	65449,4
11	15	. . . . .	32724,8

Now theſe laſt two ſines being evidently in the ſame ratio as their arcs, the ſines of all the leſs ſingle minutes will be found by ſingle proportion. So the 45th part of the ſine of 45′, gives 2909 for the ſine of 1′; which may be doubled, tripled, &c, for the ſines of 2′, 3′, &c, up to 45′.

Then, from all the foregoing primary ſines, by the theorems for halving, doubling, or tripling, and by thoſe for the ſums and differences, the reſt of the ſines are deduced, to compleat the quadrant.

But having thus determined the ſines and coſines of the firſt 30° of the quadrant, that is the ſines of the firſt and laſt 30°, thoſe of the intermediate 30° are, by theor. 4, found by one ſingle ſubtraction for each ſine.

The ſines of the whole quadrant being thus compleated, the tangents are found by theor. 18, 19, 20, namely for one half of the quadrant by the 18th and 19th, and the other half, by one ſingle addition or ſubtraction for each, by the 20th theorem.

And laſtly, by theor. 24 and 25, the ſecants are deduced from the tangents by addition and ſubtraction only.

Among the various means uſed for conſtructing the canon of ſines, tangents and ſecants, the writers above enumerated ſeem not to have been poſſeſſed of the method of differences, ſo profitably uſed ſince, and firſt of all I believe by Briggs, in computing his trigonometrical canon

canon and his logarithms, as we ſhall ſee hereafter when we come to deſcribe thoſe works. They took however the ſucceſſive differences of the numbers after they were computed, to verify or prove the truth of them; and if found erroneous, by any irregularity in the laſt differences, from thence they had a method of correcting the original numbers themſelves. At leaſt this method is uſed by Pitiſcus, *Trig. lib.* 2, where the differences are extended to the third order.——In pa. 44, of the ſame book alſo is deſcribed, for the firſt time that I know of, the common notation of decimal fractions as now uſed. And this ſame notation was afterwards deſcribed and uſed by baron Neper in *poſitio* 4 and 5 of his poſthumous work on the conſtruction of logarithms, publiſhed by his ſon in the year 1619. But the decimal fractions themſelves may be conſidered as having been introduced by Regiomontanus, by his decimal diviſion of the radius &c. of the circle; and from that time gradually brought into uſe; but continued long to be denoted after the manner of vulgar fractions, by a line drawn between the numerator and denominator, which laſt however was ſoon omitted, and only the numerator ſet down with the line below it; thus it was firſt $31\frac{35}{100}$, the $31\frac{35}{}$; afterwards omitting the line it became 31^{35}, and laſtly 31_{35} or 31.35 or 31·35: As may be traced in the works of Vieta and others ſince his time, gradually into the preſent century.

Having often heard it remarked that the word *ſine*, or in Latin and French *ſinus*, is of doubtful origin; and as the various accounts which I have ſeen of its derivation, are very different from one another, it may not be amiſs here to employ a few lines on this matter. Some authors ſay this is an Arabic word, others that it is the ſingle Latin word *ſinus*, and in Montucla's *Hiſtoire des Mathematiques*, it is conjectured to be an abbreviation of two Latin words. The conjecture is thus expreſſed by the ingenious and learned author of that excellent hiſtory, at pa. xxxiii among the additions and corrections of the firſt volume: "A l'occaſion des ſinus dont on parle dans cette page, come d'une invention des Arabes, voici une étymologie de ce nom, tout-a-fait heureuſe & vraiſemblable. Je la dois à M. Godin, de l'Académie Royale des Sciences, Directeur de l'Ecole de Marine de Cadix. Les ſinus ſont, comme l'on ſcait, des moitiés de cords; & les cordes en Latin ſe nomment *inſcriptæ*. Les ſinus ſont donc *ſemiſſes inſcriptarum*, ce que probablement on écrivit ainſi pour abréger, S. Ins. Delà enſuite s'eſt fait par abus le mot de ſinus." Now ingenious as this conjecture is, there appears to be little or no probability for the truth of it. For, in the firſt place, it is not in the leaſt ſupported by quotations from any of the more early books to ſhew that it ever was the practice to write or print the words thus *S. Ins.* upon which the conjecture is founded. Again, it is ſaid the chords are called in Latin *inſcriptæ*; and it is true that they ſometimes are ſo; but I think they are more frequently called *ſubtenſæ*, and the ſines *ſemiſſes ſubtenſarum* of the double arcs, which will not abbreviate into the word *ſinus*. But it may be ſaid, what reaſon have we to ſuppoſe this word to be either a Latin word, or the abbreviation of any Latin words whatever? that it ſeems but proper to ſeek for the etymology of *words* in the language

of the inventors of the *things*. For which reaſon it is, that we find the two other words, *tangens* and *ſecans*, are Latin, as they were invented and uſed by authors who wrote in that language. But the ſines are acknowledged to have been invented and introduced by the Arabians, and thence by analogy it would ſeem probable that this is a word of *their* language, and from them adopted, together with the uſe of it, by the Europeans. And indeed Lanſbergius, in the 2d pa. of his trigonometry above-mentioned, expreſſly ſays that it *is* Arabic: His words are, *Vox ſinus Arabica eſt, et proinde barbara; ſed cum longo uſu approbata ſit, & commodior non ſuppetat, nequaquam repudienda eſt: facilis enim in verbis nos eſſe oportet, cùm de rebus convenit.* And Vieta ſays ſomething to the ſame purport in pa. 9 of his *Univerſalium Inſpectionum ad Canonem Mathematicum Liber:* His words are, *Breve ſinus vocabulum, cùm ſitartis, Saracenis præſertim quàm familiare, non eſt ab artificibus explodendum, ad laterum ſemiſſium inſcriptorum denotationem, &c.*

Guarinus alſo is of the ſame opinion: in his *Euclides Adauctus & e. tract.* xx, *pa.* 307. he ſays, SINUS *vero eſt nomen Arabicum uſurpatum in hanc ſignificationem a mathematicis*; although he was aware that a Latin origin was aſcribed to it by Vitalis, for he immediately adds, *Licet Vitalis in ſuo Lexico Mathematico ex eo velit ſinum appellatum, quòd claudat curvitatem arcus.*

Long before I either ſaw or heard of any conjecture or obſervation concerning the etymology of the word *ſinus*, I remember that I *imagined* it to be taken from the ſame Latin word, ſignifying breaſt or boſom, and that our ſine was ſo called allegorically. I had obſerved that ſeveral of the terms in trigonometry were derived from a bow to ſhoot with, and its appendages; as *arcus* the bow, *chorda* the ſtring, and *ſagitta* the arrow, by which name the verſed ſine, which repreſents it, was ſometimes called; alſo that the *tangens* was ſo called from its office, being a line *touching* the circle, and *ſecans* from its *cutting* the ſame; I therefore imagined that the *ſinus* was ſo called, either from its reſemblance to the breaſt or boſom, or from its being a line drawn within the boſom *(ſinus)* of the arc, or from its being that part of the ſtring *(chorda)* of a bow *(arcus)* which is drawn near the breaſt *(ſinus)* in the act of ſhooting. And perhaps Vitalis's definition above-quoted has ſome alluſion to the ſame ſimilitude.

Alſo Vieta ſeems to allude to the ſame thing in calling *ſinus* an allegorical word, in pa. 417 of his works as publiſhed by Schooten, where, with his uſual judgment and preciſion, he treats of the propriety of the terms uſed in trigonometry for certain lines drawn in and about the circle, of which, as it very well deſerves, I ſhall here extract the principal part, to ſhew the opinion and arguments of ſo great a man on thoſe names. "Arabes autem ſemiſſes inſcriptas duplo, numeris præſertim æſtimatas, vocaverunt allegorice SINUS, atque ideo ipſam ſemidiametrum, quæ maxima eſt ſemiſſium inſcriptarum, SINUM TOTUM. Et de iis ſua methodo canones exataverunt qui circumferuntur, ſupputante præſertim Regiomontano bene juſte & accurate, in iis etiam particulis qualium ſemidiameter adſumitur 10,000,000.

"Ex

" Ex canonibus deinde ſinuum derivaverunt recentiores canonem ſemiſſium circumſcriptarum, quem dixere Fœcundum; & canonem educarum è centro, quem dixere Fœcundiſſimum & Beneficum, hypotenuſis addictum. Atque adeo ſemiſſes circumſcriptas, numeris præſertim æſtimatas, vocaverunt Fœcundos Sinus numeroſve videlicet; quanquam nihil vetat Fœcundi nomen ſubſtantivè accipi. Hypotenuſas autem Beneficas, vel etiam ſimpliciter Hypotenuſas: quoniam hypotenuſa in prima ſerie ſinus totius nomen retinet. Itaque ne novitate verborum res adùmbretur, & alioqui ſua artificibus eo nomine debita præripiatur gloria, præpoſita in Canone Mathematico canonicis numeris inſcriptio, candide admonet primam ſeriem eſſe Canonem Sinum. In ſecunda vero, partem canonis fœcundi, partem canonis fœcundiſſimi, contineri. In tertia, reliquam.

Sane præter inſcriptas & circumſcriptas, circulum etiam adficiunt aliæ lineæ rectæ, velut Incidentes, Tangentes, & Secantes. Verum illæ voces ſubſtantivæ ſunt, non peripheriarum relativæ. Ac ſecare quidem circulum linea recta tunc intelligitur, cum in duobus punctis ſecat. Itaque non loquuntur bene geometrice, qui eductas è centro ad metas circumſcriptarum vocant ſecantes improprie, cum ſecantes, & tangentes ad certos angulos vel peripherias referunt. Immo vero artem confundunt, cum his vocibus neceſſe habeat uti geometra abs relatione.

" Quare ſi quibus arrideat Arabum metaphora; quæ quidem aut omnino retinenda videtur, aut omnino explodenda; ut ſemiſſes inſcriptas, Arabes vocant ſinus; ſic ſemiſſes circumſcriptæ, vocentur Proſinus Amſinuſve; & eductæ è centro, Tranſſinuoſæ. Sin allegoria diſpliceat, geometrica ſane inſcriptarum & circumſcriptarum nomina retineantur. Et cum eductæ è centro ad metas circumſcriptarum, non habeant hactenus nomen certum neque elegans, voceantur ſane proſemidiametri, quaſi protenſæ ſemidiametri, ſe habentes ad ſuas circumſcriptas, ſicut ſemidiametri ad inſcriptas."

Againſt the Arabic origine however of this word *(ſinus)* may be urged its being varied according to the fourth declenſion of Latin nouns, like *manus*; and that if it were an Arabic word latinized, it would have been ranked under either the firſt, ſecond, or third declenſion, as is uſual in ſuch adopted words.

So that, upon the whole, it will perhaps rather ſeem probable, that the term *ſinus* is the Latin word anſwering to the name by which the Saracens called that line, and not their word itſelf. And this conjecture ſeems to be rendered ſtill more probable by ſome expreſſions in pa. 4 and 5 of Otho's preface to Rheticus's Canon, where it is not only ſaid, that the Saracens called the half chord of double the arc *ſinus*, but alſo that they called the part of the radius lying between the ſine and the arc *ſinus verſus vel ſegitta*, which are evidently Latin words, and ſeem to be intended for the Latin tranſlations of the names by which the Arabians called theſe lines, or the numbers expreſſing the lengths of them.

OF LOGARITHMS.

THE trigonometrical canon of natural ſines, tangents and ſecants, being now brought to a conſiderable degree of perfection; the great length and accuracy of the numbers, together with the increaſing delicacy and number of aſtronomical problems and ſpherical triangles, to the reſolution of which the canon was applied, urged many perſons, converſant in thoſe matters, to endeavour to diſcover ſome means of diminiſhing the great labour and time, requiſite for ſo many multiplications and diviſions, in ſuch large numbers as the tables then conſiſted of. And their chief aim was, to reduce the multiplications and diviſions to additions and ſubtractions, as much as poſſible.

For this purpoſe, Nicholas Raymer Urſus Dithmarſus invented an ingenious method, which ſerves for one caſe in the ſines, namely, when radius is the firſt term in the proportion, and the ſines of two arcs are the ſecond and third terms; for he ſhewed that the fourth term or ſine, would be found by only taking half the ſum or difference of the ſines of two other arcs, which ſhould be the ſum and difference of the leſs of the two former given arcs and the complement of the greater. This is no more in effect than the following well-known theorem in trigonometry: As half radius is to the ſine of one arc, ſo is the ſine of another arc to the coſine of the difference *minus* the coſine of the ſum of the ſaid arcs. The author publiſhed this ingenious device in 1588, in his *Fundamentum Aſtronomiæ*. And three or four years afterwards it was greatly improved by Clavius, who adapted it to all proportions in the reſolution of ſpherical triangles, both for ſines, tangents, ſecants, verſed ſines, &c; and that whether radius be in the proportion or not. All which he explains very fully in *lem.* 53 *lib.* 1. of his treatiſe on the *Aſtrolabe*. This method, although ingenious, depends not on any abſtract property of numbers, but only on the relations of certain lines drawn in and about the circle, and it was therefore rather limited, and ſometimes attended with trouble in the application.

After perhaps various other contrivances, inceſſant endeavours at length produced the happy invention of logarithms, which are of direct and univerſal application to all numbers abſtractedly conſidered, being derived from a property inherent in themſelves. This property may be conſidered, either as the relation between a geometrical ſeries of terms and a correſponding arithmetical one, or as the relation between ratios and the meaſures of ratios, which comes to much the ſame thing, they having been conceived in one of theſe ways by ſome of the writers on this ſubject, and in the other by the reſt of them, as well as in both ways at different times by the ſame writer. A ſummary idea of this property, and of the probable reflections made on it by the firſt writers on logarithms, may be to the following effect.

The learned calculators, about the cloſe of the 16th, and beginning of the 17th century, finding the operations of multiplication and diviſion by very long numbers of 7 or 8 places of figures, which they had

had frequently occaſion to perform in ſolving problems relating to geography and aſtronomy, to be exceedingly troubleſome, ſet themſelves to conſider whether it was not poſſible to find ſome method of leſſening this labour, by ſubſtituting other eaſier operations in their ſtead. In purſuit of this object they reflected that, ſince in every multiplication by a whole number, the ratio, or proportion, of the product to the multiplicand, is the ſame as the ratio of the multiplier to unity, it will follow that the ratio of the product to unity (which, according to Euclid's definition of compound ratios, is compounded of the ratios of the ſaid product to the multiplicand and of the multiplier to unity), muſt be equal to the ſum of the two ratios of the multiplier to unity and of the multiplicand to unity. Conſequently, if they could find a ſet of artificial numbers that ſhould be the repreſentatives of, or ſhould be proportional to, the ratios of all ſorts of numbers to unity, the addition of the two artificial numbers that ſhould repreſent the ratios of any multiplier and multiplicand to unity, would anſwer to the multiplication of the ſaid multiplicand by the ſaid multiplier, or the ſum ariſing from the addition of the ſaid repreſentative numbers, would be the repreſentative number of the ratio of the product to unity; and conſequently the natural number to which it ſhould be found, in the table of the ſaid artificial or repreſentative numbers, that the ſaid ſum belonged, would be the product of the ſaid multiplicand and multiplier. Having ſettled this principle as the foundation of their wiſhed-for method of abridging the labour of calculations, they reſolved to compoſe a table of ſuch artificial numbers, or numbers that ſhould be repreſentatives of, or proportional to, the ratios of all the common or natural numbers to unity.

The firſt obſervation that naturally occurred to them in the purſuit of this ſcheme, was that, whatever artificial numbers ſhould be choſen to repreſent the ratios of other whole numbers to unity, the ratio of equality, or of unity to unity, muſt be repreſented by 0; becauſe *that* ratio has properly no magnitude, ſince, when it is added to, or ſubtracted from, any other ratio, it neither increaſes nor diminiſhes it.

The ſecond obſervation that occurred to them was, that any number whatever might be choſen at pleaſure for the repreſentative of the ratio of any given natural number to unity; but that, when once ſuch choice was made, all the other repreſentative numbers would be thereby determined, becauſe they muſt be greater or leſs than that firſt repreſentative number, in the ſame proportions in which the ratios repreſented by them, or the ratios of the correſponding natural numbers to unity, were greater or leſs than the ratio of the ſaid given natural number to unity. Thus, either 1, or 2, or 3, &c, might be choſen for the repreſentative of the ratio of 10 to 1. But, if 1 be choſen for it, the repreſentatives of the ratios of 100 to 1 and 1000 to 1, which are double and triple of the ratio of 10 to 1, muſt be 2 and 3, and cannot be any other numbers; and, if 2 be choſen for it, the repreſentatives of the ratios of 100 to 1 and 1000 to 1 will be 4 and 6, and cannot be any other numbers; and, if 3 be choſen for it, the repreſentatives of the

the ratios of 100 to 1 and 1000 to 1 will be 6 and 9, and cannot be any other numbers; and ſo on.

The third obſervation that occurred to them was, that, as theſe artificial numbers were repreſentatives of, or proportional to, ratios of the natural numbers to unity, they muſt be expreſſions of the numbers of ſome ſmaller equal ratios that are contained in the ſaid ratios. Thus, if 1 be taken for the repreſentative of the ratio of 10 to 1, then 3, which is the repreſentative of the ratio of 1000 to 1, will expreſs the number of ratios of 10 to 1 that are contained in the ratio of 1000 to 1. And if, inſtead of 1, we make 10,000,000, or ten millions, the repreſentative of the ratio of 10 to 1, (in which caſe 1 will be the repreſentative of a very ſmall ratio, or *ratiuncula*, which is only the ten-millionth part of the ratio of 10 to 1, or will be the repreſentative of the 10,000,000th root of 10, or of the firſt or ſmalleſt of 9,999,999 mean proportionals interpoſed between 1 and 10), the repreſentative of the ratio of 1000 to 1, which will in this caſe be 30,000,000, will expreſs the number of thoſe *ratiunculæ*, or ſmall ratios of the 10,000,000th root of 10 to 1, which are contained in the ſaid ratio of 1000 to 1. And the like may be ſhewn of the repreſentative of the ratio of any other number to unity. And therefore they thought theſe artificial numbers, which thus repreſent, or are proportional to, the magnitudes of the ratios of the natural numbers to unity, might not improperly be called the LOGARITHMS of thoſe ratios, ſince they expreſs the numbers of ſmaller ratios of which they are compoſed. And then, for the ſake of brevity, they called them the *Logarithms of the ſaid natural numbers themſelves*, which are the antecedents of the ſaid ratios to unity, of which they are in truth the repreſentatives.

The foregoing method of conſidering this property, leads to much the ſame concluſions as the other way, in which the relations between a geometrical ſeries of terms, and their exponents, or the terms of an arithmetical ſeries, are contemplated. In this latter way, it readily occurred that the addition of the terms of the arithmetical ſeries correſponded to the multiplication of the terms of the geometrical ſeries; and that the arithmeticals would therefore form a ſet of artificial numbers, which, when arranged in tables with their geometricals, would anſwer the purpoſes deſired, as has been explained above.

From this property, by aſſuming four quantities, two of them as two terms in a geometrical ſeries, and the others as the two correſponding terms of the arithmeticals, or artificials, or logarithms, it is evident that all the other terms of both the two ſeries may thence be generated. And therefore there may be as many ſets or ſcales of logarithms as we pleaſe, ſince they depend intirely on the arbitrary aſſumption of the firſt two arithmeticals. And all poſſible natural numbers may be ſuppoſed to coincide with ſome of the terms of any geometrical progreſſion whatever, the logarithms or arithmeticals determining which of the terms in that progreſſion they are.

It was proper however that the arithmetical ſeries ſhould be ſo aſſumed, as that the term 0 in it might anſwer to the term 1 in the geometricals; otherwiſe the ſum of the logarithms of any two numbers would

would be always to be diminiſhed by the logarithm of 1, to give the logarithm of the product of thoſe numbers: for which reaſon, making 0 the logarithm of 1, and aſſuming any quantity whatever for the value of the logarithm of any one number, the logarithms of all other numbers were thence to be derived. And hence, like as the multiplication of two numbers is effected by barely adding their logarithms, ſo diviſion is performed by ſubtracting the logarithm of the one from that of the other, raiſing of powers by multiplying the logarithm of the given number by the index of the power, and extraction of roots by dividing the logarithm by the index of the root. It is alſo evident that, in all ſcales or ſyſtems of logarithms, the logarithm of 0 will be infinite; namely, infinitely negative if the logarithms increaſe with the natural numbers, but infinitely poſitive if the contrary; becauſe that while the geometrical ſeries muſt decreaſe through infinite diviſions by the ratio of the progreſſion, before the quotient come to 0 or nothing; the logarithms, or arithmeticals, will in like manner undergo the correſponding infinite ſubtractions or additions of the common equal difference; which equal increaſe or decreaſe, thus indefinitely continued, muſt needs tend to an infinite reſult.

This however was no newly diſcovered property of numbers, but what was always well known to all mathematicians, being treated of in the writings of Euclid, as alſo by Archimedes, who made great uſe of it in his *Arenarius*, or treatiſe on the number of the ſands, namely, in aſſigning the rank or place of thoſe terms, of a geometrical ſeries, produced from the multiplication together of any of the foregoing terms, by the addition of the correſponding terms of the arithmetical ſeries, which ſerved as the indices or exponents of the former. And the reaſon why tables of theſe numbers were not ſooner compoſed, was, that the accuracy and trouble of trigonometrical computations had not ſooner rendered them neceſſary. It is therefore not to be doubted that, about the cloſe of the ſixteenth and beginning of the ſeventeenth century, many perſons had thoughts of ſuch a table of numbers, beſides the few who are ſaid to have attempted it.

Longomontanus has, by ſome, been ſaid to have invented logarithms: but this cannot well be ſuppoſed to have been much more than in idea, ſince he never publiſhed any thing of the kind, nor ever laid claim to the invention, though he lived thirty-three years after they were firſt publiſhed by baron Neper, as he died only in 1647, when they had been long known and received all over Europe. Some circumſtances of this matter are indeed related by Wood in his *Athenæ Oxonienſes*, under the article Briggs, on the authority of Oughtred and Wingate, viz. "That one Dr. Craig a Scotchman, coming out of Denmark into his own country, called upon Joh. Neper baron of Marcheſton near Edenburgh, and told him among other diſcourſes of a new invention in Denmark (by Longomontanus as 'tis ſaid) to ſave the tedious multiplication and diviſion in aſtronomical calculations. Neper being ſolicitous to know farther of him concerning this matter, he could give no other account of it, than that it was by proportion-

able

able numbers. Which hint Neper taking, he desired him at his return to call upon him again. Craig, after some weeks had passed, did so, and Neper then shewed him a rude draught of that he called, *Canon mirabilis Logarithmorum*. Which draught, with some alterations, he printing in 1614, it came forthwith into the hands of our author Briggs, and into those of Will. Oughtred, from whom the relation of this matter came."

Kepler also says that one Juste Byrge, assistant astronomer to the landgrave of Hesse, invented, or projected, logarithms long before Neper did, but that they had never come abroad on account of the great reservedness of their author with regard to his own compositions. Byrge is also said to have computed a table of natural sines for every two seconds of the quadrant.

But whatever may have been said or conjectured concerning any thing that may have been done by others, it is certain that the world is indebted, for the first publication of logarithms, to John Napier, or Nepair *, or in Latin, Neper, baron of Merchiston, or Markinston, in Scotland, who died the 3d of April 1618, at the age of 67 years. Baron Napier added considerable improvements to trigonometry, and the frequent numerical computations he performed in this branch, gave occasion to his invention of logarithms, in order to save part of the trouble attending those calculations; and for this reason he adapted his tables peculiarly to trigonometrical uses.

This discovery he published in 1614, in his book intituled *Mirifici logarithmorum canonis descriptio*, reserving the construction of the numbers till the sense of the learned concerning his invention should be known. And, excepting the construction, this is a perfect work on

* The origine of which name Crawfurd informs us was from a (less) peerlike action of one of his ancestors, viz. Donald, second son of the earl of Lenox in the time of David the second. "Some English writers, mistaking the import of the term *baron*, having called this celebrated person lord Napier, a scotch nobleman. He was not indeed a peer of Scotland; but the peerage of Scotland informs us, that he was of a very antient, honourable, and illustrious family; that his ancestors, for many generations, had been possessed of sundry baronies, and, amongst others, of the barony of Merchistoun, which descended to him by the death of his father in 1608. Mr. Briggs, therefore, very properly stiles him *Baro Merchistonii*. Now, according to Skene, *de verborum significatione*. 'In this realm (of Scotland) he is called an Barrone, quha haldis his landes immediatelie in chiefe of the king; and hes power of Pit and Gallows; *Fossa et Furca*; quhilk was first institute and granted be king Malcolme, quha gave power to the Barrones to have ane Pit, quhairin wemen condemned for thieft suld be drowned, and ane Gallows, whereupon men thieves and trespassowres, suld be hanged, conforme to the doome given in the Barron Court thereanent.' So that a Scotch baron, though no peer, was nevertheless a very considerable personage, both in dignity and power." *Reid's Essay on Logarithms.*—The name of the illustrious inventor of logarithms, and his family, has been variously written at different times, and on different occasions. In his own Latin works, and in (perhaps) all other books in Latin, it is *Neper*, or *Neperus Baro Merchistonii*: By Briggs, in a letter to Archbishop Usher, he is called *Naper, lord of Markinston*: In Wright's translation of the logarithms, which was revised by the author himself, and published in 1616, he is called *Nepair, baron of Marchiston*; and the same by Crawfurd and some others: But M'Kenzy and others write it *Napier, baron of Merchiston*; which, being also the orthography now used by the family, I shall adopt in this work. I observe also that the Scotch Compendium of Honour says he was only Sir John Napier, and that his son and heir, Archibald, was the first lord, being raised to that dignity in 1626. Be this however as it may, I shall conform to the common modes of expression, and call him indifferently *baron Napier* or *lord Napier*.

this

this kind of logarithms, containing in effect the logarithms of all numbers, and the logarithmic ſines, tangents, and ſecants for every minute of the quadrant, together with the deſcription and uſes of the tables, as alſo his definition and idea of logarithms.

Napier explains his notion of logarithms by lines deſcribed or generated by the motion of points, in this manner: He firſt conceives a line to be generated by the equable motion of a point, which paſſes over equal portions of it in equal ſmall moments or portions of time: he then conſiders another line as generated by the unequal motion of a point, in ſuch manner, that, in the aforeſaid equal moments or portions of time, there may be deſcribed or cut off, from a given line, parts which ſhall be continually in the ſame proportion with the reſpective remainders, of that line, which had before been left: then are the ſeveral lengths of the firſt line, the logarithms of the correſponding parts of the latter. Which deſcription of them is ſimilar to this, that the logarithms are a ſeries of quantities or numbers in arithmetical progreſſion, adopted to another ſeries in geometrical progreſſion. The firſt or whole length of the line, which is diminiſhed in geometrical progreſſion, he makes the radius of a circle, and its logarithm 0 or nothing, repreſenting the beginning of the firſt or arithmetical line; and the ſeveral proportional remainders of the geometrical line, are the natural ſines of all the other parts of the quadrant decreaſing down to nothing, while the ſucceſſive increaſing values of the arithmetical line, are the correſponding logarithms of thoſe decreaſing ſines. ſo that while the natural ſines decreaſe from radius to nothing, their logarithms increaſe from nothing to infinite. Napier made the logarithm of radius to be 0, that he might ſave the trouble of adding and ſubtracting it in trigonometrical proportions, in which it ſo frequently occurred; and he made the logarithms of the ſines, from the intire quadrant down to 0, to increaſe, that they might be poſitive, and ſo in his opinion the eaſier to manage, the ſines being of more frequent uſe than the tangents and ſecants, of which the whole of the latter and half the former would, in his way, be of a different affection from the ſines; for it is evident that the logarithms of all the ſecants in the quadrant, and of all the tangents above 45°, or the half quadrant, would be negative, being the logarithms of numbers greater than the radius, whoſe logarithm is made equal to 0 or nothing.

As to the contents of Napier's table; it conſiſts of the natural ſines and their logarithms, for every minute of the quadrant. Like moſt other tables, the arcs are continued to 45 degrees from top to bottom on the left-hand ſide of the pages, and then returned backwards from bottom to top on the right-hand ſide of the pages: ſo that the arcs and their complements, with the ſines, natural and logarithmic, ſtand on the ſame line of the page, in ſix columns; and in another column, in the middle of the page, are placed the differences between the logarithmic ſines and coſines, on the ſame lines, and in the adjacent columns on the right and left; thus making in all ſeven columns in each page. Of theſe columns, the firſt and ſeventh contain the arc and its complement, in degrees and minutes; the ſecond and ſixth, the natural ſine and coſine of each arc; the third and fifth, the lagarithmic

ſine and coſine; and the fourth, or middle column, the difference between the logarithmic ſine and coſine which are in the third and fifth columns.

To elucidate the deſcription, the firſt page of the table is here inſerted.

						Gr. 9

Beſides the columns which are actually contained in this table, as above exhibited and deſcribed, namely, the natural and logarithmic ſines, and the differences of theſe, the ſame table is made to ſerve alſo for the logarithmic tangents and ſecants of the whole quadrant, and for the logarithms of common numbers. For, the fourth or middle column contains the logarithmic tangents, being equal to the differences between the logarithmic ſines and coſines when the logarithm of radius is 9, becauſe coſine : ſine : : radius : tangent, that is,

in

in logarithms, tangent = ſine — coſine. Alſo the logarithmic ſines made negative become the logarithmic coſecants, and the logarithmic coſines made negative are the logarithmic ſecants; becauſe ſine : radius : : radius : coſecant, and coſine : radius : : radius : ſecant; that is, in logarithms, coſecant = 0 — ſine = — ſine, and ſecant = 0 — coſine = — coſine. And to make it anſwer the purpoſe of a table of logarithms of common numbers, the author directs to proceed thus: A number being given, find that number in any table of natural ſines, or tangents, or ſecants, and note the degrees and minutes in its arc; then in his table find the correſponding logarithmic ſine, or tangent, or ſecant, to the ſame number of degrees and minutes; and it will be the required logarithm of the given number.

After his definitions and deſcription of logarithms, Napier explains his table, and illuſtrates the precepts with examples, ſhewing how to take out the logarithms of ſines, tangents, ſecants, and of common numbers; as alſo how to add and ſubtract logarithms. He then proceeds to teach the uſes of thoſe numbers; and firſt, in finding any of the terms of three or four proportionals, ſhewing how to multiply and divide, and to find powers and roots, by logarithms: 2dly, in trigonometry, both plane and ſpherical, but eſpecially the latter, in which he is very explicit, turning all the theorems for every caſe into logarithms, computing examples to each in numbers, and then enumerating a ſet of aſtronomical problems of the ſphere which properly belong to each caſe. Napier here teaches alſo ſome new theorems in ſpherical trigonometry, particularly that the tangent of half the baſe : tang. $\frac{1}{2}$ ſum legs : : tang. $\frac{1}{2}$ dif. legs : tang. $\frac{1}{2}$ the alternate baſe; and the general theorem for what are called his five circular parts, by which he condenſes into one rule, in two parts, the theorems for all the caſes of right-angled ſpherical triangles, which had been ſeparately demonſtrated by Pitiſcus, Lanſbergius, Copernicus, Regiomontanus, and others.

The deſcription and uſe of Napier's canon being in the Latin language, they were tranſlated into Engliſh by Mr. Edward Wright, an ingenious mathematician, and inventor of the principles of what has commonly, though erroneouſly, been called Mercator's ſailing. He ſent the tranſlation to the author, at Edinburgh, to be reviſed by him before publication; who, having carefully peruſed it, returned it with with his approbation, and a few lines introduced beſides into the tranſlation. But, Mr. Wright dying ſoon after he received it back, it was after his death publiſhed, together with the tables, but each number to one figure leſs, in the year 1616, accompanied with a dedication, by his ſon Samuel Wright, to the Eaſt-India Company, as alſo a preface by Henry Briggs, of whom we ſhall preſently have occaſion to ſpeak more at large, on account of the great ſhare he bore in perfecting the logarithms. In this tranſlation Mr. Briggs gave alſo the deſcription and draught of a ſcale that had been invented by Mr. Wright, and ſeveral other methods of his own, for finding the proportional parts to intermediate numbers, the logarithms having been only printed for ſuch numbers as were the natural ſines of each mi-

nute. And the note which baron Napier inſerted in this Engliſh edition, and which was not in the original, was as follows: "But be-
"cauſe the addition and ſubtraction of theſe former numbers may
"ſeem ſomewhat painfull, I intend (if it ſhall pleaſe God) in a ſecond
"edition, to ſet out ſuch logarithms as ſhall make thoſe numbers
"above written to fall upon decimal numbers, ſuch as 100000000,
"200000000, 300000000, &c. which are eaſie to be added or abated
"to or from any other number." This note had reference to the alteration of the ſcale of logarithms in ſuch manner, that 1 ſhould become the logarithm of the ratio of 10 to 1, inſtead of the number 2·3025851, which Napier had made that logarithm in his table, and which alteration had before been recommended to him by Briggs, as we ſhall ſee preſently. Napier alſo inſerted a ſimilar remark in his *Rabdologia*, which he printed at Edinburgh in 1617.

The following is the preface to Wright's book, which, as far as where it mentions the change from the Latin into Engliſh, is a literal tranſlation of the preface to Napier's original; but what follows that, is added by Napier himſelf. And I willingly inſert it here, as it contains a declaration of the motives which led to this diſcovery, and as the book itſelf is very ſcarce. "Seeing there is nothing, (right well beloved ſtudents in the mathematics) that is ſo troubleſome to Mathematicall practiſe, nor that doth more moleſt and hinder Calculators, then the Multiplications, Diviſions, ſquare and cubical Extractions of great numbers, which beſides the tedious expence of time, are, for the moſt part ſubject to many ſlippery errors. I began therefore to conſider in my minde, by what certaine and ready Art I might remove thoſe hindrances, And having thought upon many things to this purpoſe, I found at length ſome excellent briefe rules to be treated of (perhaps) hereafter. But amongſt all, none more profitable then this, which together with the hard and tedious Multiplications, Diviſions, and

* Of this ingenious man I ſhall here inſert in a note the following memoirs, as they have been tranſlated from a Latin piece taken out of the annals of Gonvile and Caius College in Cambridge, viz. "This year (1615) died at London Edward Wright of Garveſton in Norfolk, formerly a fellow of this college; a man reſpected by all for the integrity and ſimplicity of his manners, and alſo famous for his ſkill in the mathematical ſciences: Inſomuch that he was deſervedly ſtiled a moſt excellent mathematician by Richard Hackluyt, the author of an original treatiſe of our Engliſh navigations. What knowledge he had acquired in the ſcience of mechanics, and how uſefully he employed that knowledge to the public as well as private advantage, abundantly appear both from the writings he publiſhed, and from the many mechanical operations ſtill extant, which are ſtanding monuments of his great induſtry and ingenuity. He was the firſt undertaker of that difficult but uſeful work, by which a little river is brought from the town of Ware in a new Canal, to ſupply the city of London with water; but by the tricks of others he was hindered from compleating the work he had begun. He was excellent both in contrivance and execution, nor was he inferior to the moſt ingenious mechanic in the making of inſtruments, either of braſs or any other matter. To his invention is owing whatever advantage Hondius's geographical charts have above others; for it was our Wright that taught JodocusHondius the method of conſtructing them which was till then unknown; but the ungrateful Hondius concealed the name of the true author, and arrogated the glory of the invention to himſelf. Of this fraudulent practice the good man could not help complaining, and juſtly enough, in the preface to his treatiſe of the Correction of Errors in the Art of Navigation; which he compoſed with excellent judgment, and after long experience, to the great advancement of naval affairs. For the improvement of this

and Extractions of rootes, doth alſo caſt away from the worke it ſelfe, even the very numbers themſelves that are to be multiplied, divided, and reſolved into rootes, and putteth other numbers in their place, which performe as much as they can do, onely by Addition and Subtraction, Diviſion by two, or Diviſion by three; which ſecret invention, being (as all other good things are) ſo much the better as it ſhall be the more common; I thought good heretofore to ſet forth in Latine for the publique uſe of Mathematicians. But now ſome of our Countrymen in this Iſland well affected to theſe ſtudies, and the more publique good, procured a moſt learned Mathematician to tranſlate the ſame into our vulgar Engliſh tongue, who after he had finiſhed it, ſent the Coppy of it to me, to bee ſeene and conſidered on by myſelf. I having moſt willingly and gladly done the ſame, finde it to bee moſt exact and preciſely conformable to my minde and the originall. Therefore it may pleaſe you who are inclined to theſe ſtudies, to receive it from me and the Tranſlator, with as much good will as we recommend it unto you. Fare yee well."

There are alſo extant copies of Wright's * tranſlation with the date 1618 in the title; but this is not properly a new edition, but only the old work with a new title page adapted to it (the old one being cancelled), together with the addition of ſixteen pages of new matter, called "An appendix to the Logarithms, ſhewing the practice of the calculation of triangles, and alſo a new and ready way for the exact finding out of ſuch lines and logarithmes as are not preciſely to be found in the canons." But we are not told by what author: probably it was by Briggs.

Beſides the trouble attending Napier's canon, in finding the proportional parts, when uſed as a table of the logarithms of common numbers, and which was in part remedied by the fore-mentioned contrivances of Wright and Briggs, it was alſo accompanied with another inconvenience, which aroſe from the logarithms being ſometimes +

---

this art he was appointed mathematical lecturer by the Eaſt India Company, and read lectures in the houſe of that worthy knight Sir Thomas Smith, for which he had a yearly ſalary of 50 pounds. This office he diſcharged with great reputation, and much to the ſatisfaction of his hearers. He publiſhed in Engliſh a book on the doctrine of the ſphere, and another concerning the conſtruction of ſun-dials. He alſo prefixed an ingenious preface to the learned Gilbert's book on the load-ſtone. By theſe and other his writings, he has tranſmitted his fame to lateſt poſterity. While he was yet a fellow of this college, he could not be concealed in his private ſtudy, but was called forth to the public buſineſs of the kingdom, by the queen's majeſty, about the year 1593. He was ordered to attend the earl of Cumberland in ſome maritime expeditions. One of theſe he has given a faithful account of, in the way of a journal or ephemeris, to which he has prefixed an elegant hydrographical chart of his own contrivance. A little before his death he employed himſelf about an Engliſh tranſlation of the book of logarithms, then lately found out by the honourable baron Napier, a Scotchman, who had a great affection for him. This poſthumous work of his was publiſhed ſoon after, by his only ſon Samuel Wright, who was alſo a ſcholar of this college. He had formed many other uſeful deſigns, but was hindered by death from bringing them to perfection. Of him it may be truly ſaid, that he ſtudied more to ſerve the public than himſelf; and though he was rich in fame, and in the promiſes of the great, yet he died poor, to the ſcandal of an ungrateful age."

Other anecdotes of him, as well as many other mathematical authors, may be found in the curious hiſtory of navigation by Dr. James Wilſon, prefixed to Mr. Robertſon's excellent treatiſe on that ſubject.

or additive, and ſometimes — or negative, and which required therefore the knowledge of algebraic addition and ſubtraction. And this inconvenience was occaſioned partly by making the logarithm of radius to be 0, and the ſines to decreaſe, and partly by the compendious manner in which the author had formed the table; making the three columns of ſines, coſines and tangents, to ſerve alſo for the other three of coſecants, ſecants, and cotangents.

But this latter inconvenience was well remedied by John Speidell in his *New Logarithms*, firſt publiſhed in 1619, which contained all the ſix columns, and in this order; ſines, coſines, tangents, cotangents, ſecants, coſecants: and they were beſides made all poſitive, by being taken the arithmetical complements of Napier's, that is, they were the remainders left by ſubtracting each of theſe latter from 10000000. And the former inconvenience was more effectually removed by the ſaid Speidell, in an additional table, given in the ſixth impreſſion of the former work, in the year 1624. This was a table of Napier's logarithms for the round or integer numbers 1, 2, 3, 4, 5, &c, to 1000, together with their differences and arithmetical complements; as alſo the halves of the ſaid logarithms, with their differences and arithmetical complements; which halves conſequently were the logarithms of the ſquare roots of the ſaid numbers. Theſe logarithms are however a little varied in their form from Napier's, namely, ſo as to increaſe *from* 1, whoſe logarithm is 0, inſtead of decreaſing *to* 1, or radius, whoſe logarithm Napier made 0 likewiſe; that is, Speidell's logarithm of any number n, is equal to Napier's logarithm of its reciprocal $\frac{1}{n}$: So that in this laſt table of Speidell's, the logarithm of 1 being 0, the logarithm of 10 is 2302584, the logarithm of 100 is twice as much or 4605168, and that of 1000 thrice as much or 6907753.

This table is now commonly called *hyperbolic* logarithms, becauſe the numbers expreſs the areas between the aſymptote and curve of the hyperbola, thoſe areas being limited by ordinates parallel to the other aſymptote, the ordinates decreaſing in goemetrical progreſſion. But this is an improper method of denominating them, as ſuch areas may be made to denote any ſyſtem of logarithms whatever, as we ſhall ſhew more at large in the proper place.

In the year 1619, Robert Napier, ſon of the inventor of logarithms, publiſhed a new edition of his late father's *Logarithmorum Canonis Deſcriptio*, together with the promiſed *Logarithmorum Canonis Conſtructio*, and other miſcellaneous pieces written by his father and Mr. Briggs.—Alſo one Bartholomew Vincent, a bookſeller at Lugdunum, or Lyons, in France, printed there an exact copy of the ſame two works in one volumn, in the year 1620; which was four years before the logarithms were carried to France by Wingate, who was therefore erroneouſly ſaid to have firſt introduced them into that country. But I ſhall treat more particularly of the contents of this work after I have enumerated the other writers on this ſort of logarithms.

In 1618 or 1619, Benjamin Urſinus, mathematician to the Elector of Brandenburg, publiſhed, at Cologn, his *Curſus Mathematicus*, in which is contained a copy of Napier's logarithms, with the addition

of

of ſome tables of proportional parts. And in 1624 he printed at the ſame place, his *Trigonometria*, with a table of natural ſines and their logarithms, of the Napierian kind and form, to every ten ſeconds in the quadrant; which he had been at much pains in computing.

In the ſame year 1624, logarithms, of nearly the ſame kind, were alſo publiſhed, at Marpurg, by the famous John Kepler, mathematician to the Emperor Ferdinand the ſecond, under the title of *Chilias Logarithmorum ad Totidem Numeros Rotundos, præmiſſa Demonſtratione legitima Ortus Logarithmorum eorumque Uſus, &c.* and the year following, a ſupplement to the ſame; being applied to round or integer numbers, and to ſuch natural ſines as nearly coincide with them. Theſe are exactly the ſame ſort of logarithms as Napier's, being the ſame logarithms of the natural ſines of arcs beginning from the quadrant, whoſe ſine or radius is 10000000, the logarithm of which is made 0, and from thence the ſines decreaſing by equal differences, down to 0, or the beginning of the quadrant, whilſt their logarithms increaſe to infinity. So that the difference between this table and Napier's conſiſts only in this, namely, that in Napier's table the *arc* of the quadrant is divided into equal parts, differing by one minute each, and conſequently their ſines, to which the logarithms are adapted, are irrational or interminate numbers, and only expreſſed by approximate decimals; whereas in Kepler's table, the *radius* is divided into equal parts, which are conſidered as perfect and terminate ſines, having equal differences, and to which terminate ſines the logarithms are here adapted. By this means indeed the proportions for intermediate numbers and logarithms are eaſier made, but then the correſponding arcs are not terminate, but irrational, and only ſet down to an approximate degree. So that Kepler's table is more convenient as a table of the logarithms of common numbers, and Napier's as the logarithmic ſines of the arcs of the quadrant. In both tables the logarithm of the ratio of 10 to 1, is the ſame quantity, namely 23025852; and as the radius, or greateſt ſine, is 10000000, whoſe logarithm is made 0, the logarithms of the decuple parts of it will be found by adding 23025852 continually, or multiplying this logarithm by 2, 3, 4, &c. and hence the logarithm of 1, the firſt number, or ſmalleſt ſine, in the table, is 161180959, or 7 times 2302 &c.

Beſides the two columns of the natural ſines and their logarithms, with the differences of the logarithms, this table of Kepler's conſiſts alſo of three other columns; the firſt of which contains the neareſt arcs, belonging to thoſe ſines, expreſſed in degrees, minutes and ſeconds; and the other two expreſs what parts of the radius each ſine is equal to, namely, the one of them in 24th parts of the radius, and minutes and ſeconds of them; and the other in 60th parts of the radius, and minutes of them. As a ſpecimen I have here extracted the laſt page of the table, printed exactly as in the work.

To the table Kepler prefixes a pretty conſiderable tract, containing the conſtruction of the logarithms, and a demonſtration of their properties and ſtructure, in which he conſiders logarithms, in the true and legitimate way, as the meaſures of ratios, as ſhall be ſhewn more particularly hereafter in the next part, where I ſhall treat of the conſtruction of logarithms.

Kepler alſo introduced the logarithmic calculus into his Rudolphine tables, publiſhed in 1627; and inſerted in that work ſeveral logarithmic tables; as firſt, a table ſimilar to that above deſcribed, except that the ſecond, or column of ſines, or of abſolute numbers, is omitted, and inſtead of it another column is added, ſhewing what part of the quadrant each arc is equal to, namely the quotient, expreſſed in integers and ſexageſimal parts, ariſing from the dividing the whole quadrant by each given arc; 2dly, Napier's table of logarithmic ſines to every minute of the quadrant; alſo two other ſmaller tables adapted for the purpoſes of eclipſes and the latitudes of the planets.—In this work alſo Kepler gives a ſummary account of logarithms, with the

the deſcription and uſe of thoſe that are contained in theſe tables. And here it is that he mentions Juſtus Byrgius, as having had logarithms before Napier publiſhed them.

Beſides the above, ſome few others publiſhed logarithms of the ſame ſort about this time.—But let us now return to treat of the hiſtory of the common or Brigg's logarithms, ſo called becauſe he firſt computed them, and firſt mentioned them, and recommended them to Napier, inſtead of the firſt ſort by him invented.

Mr. Henry Briggs, not leſs eſteemed for his great probity and other eminent virtues, than for his excellent ſkill in mathematics, was, at the time of the publication of Napier's logarithms, in 1614, profeſſor of geometry in Greſham college in London, having been appointed the firſt profeſſor after its inſtitution; which appointment he held till January 1620, when he was choſen, alſo the firſt, Savilian profeſſor of geometry at Oxford, where he died January the 26th, 163$\frac{0}{1}$, aged about 74 years.

On the publication of Napier's logarithms, Briggs immediately applied himſelf to the ſtudy and improvement of them. In a letter to Mr. (afterwards archbiſhop) Uſher, dated the 10th of March 1615, he writes "that he was wholly taken up and employed about the noble invention of logarithms lately diſcovered." And again, "Napier lord of Markinſton hath ſet my head and hands at work with his new and admirable logarithms; I hope to ſee him this ſummer, if it pleaſe God; for I never ſaw a book which pleaſed me better, and made me more wonder." Thus we find that Briggs began very early to compute logarithms: but theſe were not of the ſame kind with Napier's, in which the logarithm of the ratio of 10 to 1 was 2·3025851 &c. for in Brigg's firſt attempt he made 1 the logarithm of that ratio; and, from the evidence we have, he appears to be the firſt perſon who formed the idea of this change in the ſcale, which he preſently and generouſly communicated both to the public in his lectures, and to lord Napier himſelf, who afterwards ſaid that he alſo had thought of the ſame thing; as appears by the following extract, tranſlated from the preface to Briggs's *Arithmetica Logarithmica*; "Wonder not, ſays he, that theſe logarithms are different from thoſe which the excellent baron of *Marchiſton* publiſhed in his Admirable Canon. For when I explained the doctrine of them to my auditors at Greſham College in London, I remarked that it would be much more convenient, the logarithm of the ſine total or radius being 0 (as in the *Canon Mirificus*), if the logarithm of the 10th part of the ſaid radius, namely of 5° 44′ 21″, were 100000 &c. and concerning this I preſently wrote to the author; alſo as ſoon as the ſeaſon of the year and my public teaching would permit, I went to Edinburgh, where being kindly received by him, I ſtaid a whole month. But when we began to converſe about the alteration of them, he ſaid that he had formerly thought of it and wiſhed it; but that he choſe to publiſh thoſe that were already done, till ſuch time as his leiſure and health would permit him to make others more convenient. And as to the nature of the change, he thought it more expedient that 0 ſhould be made the logarithm of 1,

and 100000 &c. the logarithm of radius, which I could not but acknowledge was much better. Therefore, rejecting thoſe which I had before prepared, I proceeded at his exhortation to calculate theſe; and the next ſummer I went again to Edinburgh, to ſhew him the principal of them: and ſhould have been glad to do the ſame the third ſummer, if it had pleaſed God to ſpare him ſo long."

So that it is plain that Briggs was the inventor of the preſent ſcale of logarithms, in which 1 is the logarithm of the ratio of 10 to 1, and 2 that of 100 to 1, &c. and that the ſhare which Napier had in them, was only adviſing Briggs to begin at the loweſt number 1, and make the logarithms, or artificial numbers, as Napier had alſo called them, to *increaſe* with the natural numbers inſtead of *decreaſing*; which made no alteration in the figures that expreſſed Briggs's logarithms, but only in their affection or ſigns, changing them from negative to poſitive; ſo that Briggs's firſt logarithms to the numbers in the ſecond column of the annexed tablet, would have been as in the firſt column; but after they were changed, as they are here in the third column; which is a change of no eſſential difference, as the logarithm of the ratio of 10 to 1, the radix of the natural ſyſtem of numbers, continues the ſame, a change in the logarithm of that ratio being the only circumſtance that can eſſentially alter the ſyſtem of logarithms, the logarithm of 1 being 0. And the reaſon why Briggs, after that interview, rejected what he had before done, and began anew, was probably becauſe he had adapted his new logarithms to the approximate ſines of arcs, inſtead of the round or integer numbers, and not from their being logarithms of another ſyſtem, as were thoſe of Napier.

On Briggs's return from Edinburgh to London the ſecond time, namely in 1617, he printed the firſt thouſand logarithms, to eight places of figures beſides the index, under the title of *Logarithmorum Chilias prima*. But theſe ſeem not to have been publiſhed till after the death of Napier, which happened on the third of April 1618, as before-ſaid; for in the preface to them Briggs ſays, "why theſe logarithms differ from thoſe ſet forth by their moſt illuſtrious inventor, of ever reſpectful memory, in his *Canon Mirificus*, IT IS TO BE HOPED his poſthumous work will ſhortly make appear." And as Napier, after communication had with Briggs on the ſubject of altering the ſcale of logarithms, had given notice, both in Wright's tranſlation, and in his own *Rabdologia*, printed in 1617, of his intention to alter the ſcale (though it appears very planely that he never intended to compute any more), without making any mention of the ſhare which Briggs had in the alteration, this gentleman modeſtly gave the above hint. But not finding any regard paid to it in the ſaid poſthumous work, publiſhed by lord Napier's ſon in 1619, where the alteration is again adverted to, but ſtill without any mention of Briggs; this gentleman thought he could not do leſs than ſtate the grounds of that alteration

teration himſelf, as they are above extracted from his work publiſhed in 1624.

Thus, upon the whole matter, it ſeems evident that Mr. Briggs, whether he had thought of this improvement in the conſtruction of logarithms, of making 1 the logarithm of the ratio of 10 to 1, before lord Napier, or not, (which is a ſecret that could be known only to Napier himſelf), was the firſt perſon who communicated the idea of ſuch an improvement to the world; and that he did this in his lectures to his auditors at Greſham College in the year 1615, very ſoon after his peruſal of Napier's *Canon Mirificus Logarithmorum* in the year 1614. He alſo mentioned it to Napier, both by letter in the ſame year, and on his firſt viſit to him in Scotland in the ſummer of the year 1616, when Napier approved the idea, and ſaid it had already occured to himſelf, and that he had determined to adopt it. It would therefore have been more candid in lord Napier to have told the world in the ſecond edition of this book, that Mr. Briggs had mentioned this improvement to him, and that he had thereby been confirmed in the reſolution he had already taken, before Mr. Briggs's communication with him, to adopt it in that his ſecond edition, as being better fitted to the decimal notation of arithmetic which was in general uſe. Such a declaration would have been but a piece of juſtice to Mr. Briggs; and the not having made it, cannot but incline us to ſuſpect that lord Napier was deſirous that the world ſhould aſcribe to him alone the merit of this very uſeful improvement of the logarithms, as well as that of having originally invented them; though, if the having firſt communicated an invention to the world be ſufficient to intitle a man to the honour of having firſt invented it, Mr. Briggs had the better title to be called the firſt inventor of this happy improvement of logarithms.

In 1620, two years after the *Chilias Prima* of Briggs came out, Mr. Edward Gunter publiſhed his *Canon of Triangles*, which contains the artificial or logarithmetic ſines and tangents, for every minute, to ſeven places of figures, beſides the index, the logarithm of radius being 10·0 &c. Theſe logarithms are of the kind laſt agreed upon by Napier and Briggs, and they were the firſt tables of logarithmic ſines and tangents that were publiſhed of this ſort. Gunter alſo in 1623 reprinted the ſame in his book *De Sectore et Radio*, together with the *Chilias Prima* of his old colleague Mr. Briggs, he being profeſſor of Aſtronomy at Greſham college when Briggs was profeſſor of Geometry there, Gunter having been elected to that office the ſixth of March 1619, and enjoyed it till his death, which happened on the tenth of December 1626, about the forty-fifth year of his age. In 1623 alſo Gunter applied theſe logarithms of numbers, ſines and tangents, to ſtraight lines drawn on a ruler; with which proportions in common numbers and trigonometry were reſolved by the mere application of a pair of compaſſes; a method founded on this property, that the logarithms of the terms of equal ratios are equidifferent. This inſtrument, in the form of a two-foot ſcale, is now in common uſe for navigation and other purpoſes, and is commonly called the Gun-

ter. He alſo greatly improved the ſector for the ſame uſes. Gunter was the firſt who uſed the word *co-ſine* for the ſine of the complement of an arc. He alſo introduced the uſe of arithmetical complements into the logarithmical arithmetic, as is witneſſed by Briggs, chap. xv. Arith. Log. And it has been ſaid that he ſtarted the idea of the logarithmic curve, which was ſo called becauſe the ſegments of its axis are the logarithms of the correſponding ordinates.

The logarithmic lines were afterways drawn in various other ways. In 1627 they were drawn by Wingate, on two ſeparate rulers, ſliding againſt each other, to ſave the uſe of compaſſes in reſolving proportions. They were alſo in 1627 applied to concentric circles, by Oughtred. Then in a ſpecial form by a Mr. Milburne of Yorkſhire, about the year 1650. And laſtly, in 1657, on the preſent ſliding rule, by Seth Partridge.

The diſcoveries relating to logarithms were carried to France by Mr. Edmund Wingate, but not firſt of all as he erroneouſly ſays in the preface to his book. He publiſhed at Paris, in 1624, two ſmall tracts in the French language; and afterwards at London, in 1626, an Engliſh edition of the ſame, with improvements. In the firſt of theſe he teaches the uſe of Gunter's ruler; and in the other, that of Briggs's logarithms, and the artificial ſines and tangents. Here are contained alſo tables of thoſe logarithms, ſines, and tangents, copied from Gunter. The edition of theſe logarithms printed at London in 1635, and the former editions alſo I ſuppoſe, has the units figures diſpoſed along the tops of the columns, and the tens down the margins, like our tables at preſent; but the whole logarithm, which was only to ſix places of figures, in the angle of meeting. Which is the firſt inſtance that I have ſeen of this mode of arrangement.

But proceed we now to the larger ſtructure of logarithms.

Briggs had continued from the beginning to labour, with great induſtry, at the computation of thoſe logarithms of which he before publiſhed a ſhort ſpecimen in ſmall numbers. And in 1624 he produced his *Arithmetica Logarithmica*, a ſtupendous work for ſo ſhort a time! containing the logarithms of 30000 natural numbers, to fourteen places of figures beſides the index, namely from 1 to 20000, and from 90000 to 100000; together with the differences of the logarithms. Some writers ſay that there was another *chiliad*, namely from 100000 to 101000; but none of the copies that I have ſeen have more than the 30000 above-mentioned, and they were all regularly terminated in the uſual way with the word FINIS. The preface to theſe logarithms contains, among other things, an account of the alteration made in the ſcale by Napier and himſelf, from which we before gave an extract; and an earneſt ſolicitation to others to undertake the computation for the intermediate numbers, offering to give inſtructions, and paper ready ruled for that purpoſe, to any perſons ſo inclined to contribute to the completion of ſo valuable a work. In the introduction he gives alſo an ample treatiſe on the conſtruction and uſes of theſe logarithms, which will be particularly deſcribed hereafter.——By this invitation, and other means, he had hopes of collecting materials

for

for the logarithms of the intermediate 70000 numbers, whilſt he ſhould employ his own labour more immediately upon the canon of logarithmic ſines and tangents, and ſo carry on both works at once; as indeed they were both equally neceſſary, and he himſelf was now pretty far advanced in years.

Soon after this Adrian Vlacq, or Flack, of Gouda in Holland, compleated the intermediate ſeventy chiliads, and republiſhed the *Arithmetica Logarithmica* at that place, in 1627 and 1628, with thoſe intermediate numbers, making in the whole the logarithms of all numbers to 100000, but only to ten places of figures. To theſe was added a table of artificial ſines, tangents and ſecants, to every minute of the quadrant.

Briggs himſelf lived alſo to compleat a table of logarithmic ſines and tangents for the hundredth part of every degree, to fourteen places of figures beſides the index; together with a table of natural ſines for the ſame parts to fifteen places, and the tangents and ſecants for the ſame to ten places; with the conſtruction of the whole. Theſe tables were printed at *Gouda*, under the care of Adrian Vlacq, and moſtly finiſhed off before 1631, though not publiſhed till 1633. But his death, which then happened, prevented him from compleating the application and uſes of them. However, the performing of this office, when dying, he recommended to his friend Henry Gellibrand, who was then profeſſor of Aſtronomy in Greſham college, having ſucceeded Mr. Gunter in that appointment. Gellibrand accordingly added a preface and the application of the logarithms to plane and ſpherical trigonometry &c. and the whole was printed at Gouda, by the ſame printer, and brought out in the ſame year, 1633, as the *Trigonometria Artificialis* of Vlacq, who had the care of the preſs, as aboveſaid. This work was called *Trigonometria Britannica*; and beſides the arcs in degrees and centeſms of degrees, it has another column containing the minutes and ſeconds anſwering to the ſeveral centeſms in the firſt column.

In 1633, as mentioned above, Vlacq printed, at Gouda in Holland, his *Trigonometria Artificialis: ſive Magnus Canon Triangulorum Logarithmicus ad Decadas Secundorum Scrupulorum conſtructus.* This work contains the logarithmic ſines and tangents to 10 places of figures, with their differences, for every 10 ſeconds in the quadrant. To them is alſo added Brigg's table of the firſt 20000 logarithms, but carried only to 10 places of figures beſides the index, with their differences. The whole is preceded by a deſcription of the tables, and the application of them to plane and ſpherical trigonometry, chiefly extracted from Briggs's *Trigonometria Britannica*, mentioned above.

Gellibrand publiſhed alſo, in 1635, *An Inſtitution Trigonometricall*, containing the logarithms of the firſt 10000 numbers, with the natural ſines, tangents and ſecants, and the logarithmic ſines and tangents, for degrees and minutes, all to ſeven places of figures beſides the index; as alſo other tables proper for navigation; with the uſes of the whole. Gellibrand died the 9th of February 1636, in the 40th year of his age, to the great loſs of the mathematical world.

Beſides

Beſides the perſons hitherto mentioned, who were moſtly computers of logarithms, many others have alſo publiſhed tables of thoſe artificial numbers, more or leſs compleat, and ſometimes improved and varied in the manner and form of them. I ſhall here juſt advert to a few of the principal.

In 1626, D. Henrion publiſhed, at Paris, a treatiſe concerning Briggs's logarithms of common numbers from 1 to 20000, to eleven places of figures; with the ſines and tangents to eight places only.

In 1631 was printed at London, by one George Miller, a book, containing Brigg's logarithms, with their differences, to ten places of figures beſides the index, for all numbers to 100000; as alſo the logarithmic ſines, tangents and ſecants for every minute of the quadrant; with the explanation and uſes in Engliſh.

The ſame year 1631, Richard Norwood publiſhed his *Trigonometrie*; in which we find Briggs's logarithms for all numbers to 10000, and for the ſines, tangents and ſecants to every minute, both to ſeven places beſides the index.—In the concluſion of the trigonometry he complains of the unfair practices of printing Vlacq's book in 1627 or 1628, and the book mentioned in the laſt article. His words are, "Now whereas I have here, and in ſundry places in this book, cited Mr. Briggs his *Arithmetica Logarithmica*, (leſt I may ſeem to abuſe the reader) you are to underſtand not the book put forth about a month ſince in Engliſh, as a tranſlation of his, and with the ſame title; being nothing like his, nor worthy his name; but the book which himſelf put forth with this title in Latin, being printed at London, anno 1624. And here I have juſt occaſion to blame the ill dealing of theſe men, both in the matter before mentioned, and in printing a ſecond edition of his *Arithmetica Logarithmica* in Latin, whilſt he lived, againſt his mind and liking; and brought them over to ſell, when the firſt were unſold; ſo fruſtrating thoſe additions which Mr. Briggs intended in his ſecond edition, and moreover leaving out ſome things that were in the firſt edition of ſpecial moment, A practice of very ill conſequence, and tending to the great diſparagement of ſuch as take pains in this kind."

Francis Bonaventure Cavalerius publiſhed at Bologna, in 1632, his *Directorium Generale Uranometricum*, in which are tables of Brigg's logarithms of ſines, tangents, ſecants, and verſed ſines, each to eight places, for every ſecond of the firſt five minutes, for every five ſeconds from five to ten minutes, for every ten ſeconds from ten to twenty minutes, for every twenty ſeconds from twenty to thirty minutes, for every thirty ſeconds from 30′ to 1° 30′, and for every minute in the reſt of the quadrant; which is the firſt table of logarithmic verſed ſines that I know of. In this book are contained alſo the logarithms of the firſt ten chiliads of natural numbers, namely from 1 to 10000, diſpoſed in this manner, all the twenties at top, and from 1 to 19 on the ſide, the logarithm of the ſum being in the ſquare of meeting. In this work alſo I think Cavalerius firſt gave the method of finding the area or ſpherical ſurface contained by various arcs deſcribed on the ſurface of a ſphere.

Alſo

Alſo in the *Trigonometria* of the ſame author, printed in 1643, beſides the logarithms of numbers from 1 to 1000, to eight places, with their differences, we find both natural and logarithmic ſines, tangents and ſecants, the former to ſeven and the latter to eight places; namely, to every 10″ of the firſt 30 minutes, to every 30″ from 30′ to 1°; and the ſame for their complements, or backwards through the laſt degree of the quadrant; the intermediate 88° being to every minute only.

Mr. Nathaniel Roe, "Paſtor of Benacre in Suffolke," alſo reduced the logarithmic tables to a contracted form, in his *Tabulæ Logarithmicæ*, printed at London in 1633. Here we have Briggs's logarithms of numbers from 1 to 100000, to eight places; the fifties placed at top, and from 1 to 50 on the ſide; alſo the firſt four figures of the logarithms at top, and the other four down the columns. They contain alſo the logarithmic ſines and tangents to every 100th part of degrees, to ten places.

Ludovicus Frobenius publiſhed at Hamburgh, in 1634, his *Clavis Univerſa Trigonometriæ*, containing tables of Briggs's logarithms of numbers from 1 to 2000; and of ſines, tangents, and ſecants, for every minute; both to ſeven places.

But the tables of logarithms of common numbers was reduced to its moſt convenient form by John Newton, in his *Trigonometria Britannica*, printed at London in 1658, having availed himſelf of both the improvements of Wingate and Roe, namely, uniting Wingate's diſpoſition of the natural numbers with Roe's contracted arrangement of the logarithms, the numbers being all diſpoſed as in our beſt tables at preſent, namely, the units along the top of the page, and the tens down the left-hand ſide, alſo the firſt three figures of each logarithm in the firſt column, and the remaining five figures in the other columns, the logarithms being to eight places. This work contains alſo the logarithmic ſines and tangents, to eight figures beſides the index, for every 100th part of a degree, with their differences, and for 1000th parts in the firſt three degrees.—In the preface to this work, Newton takes occaſion, as Wingate and Norwood had done before, as well as Briggs himſelf, to cenſure the unfair practices of ſome other publiſhers of logarithms. He ſays, "In the ſecond part of this inſtitution, thou art preſented with Mr. Gellibrand's Trigonometrie, faithfully tranſlated from the Latin copy, that which the author himſelf publiſhed under the title of *Trigonometria Britannica*, and not that which Vlacq the Dutchman ſtiles *Trigonometria Artificialis*, from whoſe corrupt and imperfect copy that ſeems to be tranſlated, which is amongſt us generally known by the name of *Gellibrands Trigonometry*, but thoſe who either knew him, or have peruſed his writings, can teſtifie that he was no admirer of the old ſexagenary way of working, nay, that he did preferre the decimal way before it, as he hath abundantly teſtified in all the examples of this his Trigonometry, which differs from that other which Vlacq hath publiſhed, and that which hath hitherto borne his name in Engliſh, as in the form; ſo likewiſe in the matter of it; for in the two laſt-mentioned editions, there is ſomething

thing left out in the ſecond chapter of plain triangles, the third chapter wholly omitted, and a part of the third in the ſpherical, but in this edition nothing, ſomething we have added to both, by way of explanation and demonſtration."

In 1670, John Caramuel publiſhed his *Mathefis Nova*, in which are contained 1000 logarithms both of Napier's and Briggs's form, as alſo 1000 of what he calls the Perfect Logarithms, namely the ſame as thoſe which Briggs firſt thought of, which differ from the laſt only in this, that the one increaſes while the other decreaſes, the radix, or logarithm of the ratio of 10 to 1, being the ſame in both.

The books of logarithms have ſince become very numerous, but the logarithms are moſtly of that ſort invented by Briggs, and which are now in common uſe. Of theſe the moſt noted for their accuracy or uſefulneſs, beſides the works above-mentioned, are Vlacq's ſmall volume of tables, particularly that edition printed at Lyons in 1670; alſo tables printed at the ſame place in 1760; but moſt eſpecially the tables of Sherwin and Gardiner. Of theſe, Sherwin's *Mathematical Tables* in 8vo, form the moſt compleat collection of any, containing, beſides the logarithms of all numbers to 101000, the ſines, tangents, ſecants, and verſed ſines, both natural and logarithmic, to every minute of the quadrant. The firſt edition was in 1706; but the third edition, in 1742, which was reviſed by Gardiner, is eſteemed the moſt correct of any: as to the laſt or fifth edition, in 1771, it is ſo erroneouſly printed, that no dependence can be placed in it, and it is the moſt inaccurate book of tables I ever knew; I have a liſt of ſeveral thouſand errors which I have corrected in it.

Gardiner alſo printed at London, in 1742, a quarto volume of "Tables of Logarithms, for all numbers from 1 to 102100, and for the ſines and tangents to every ten ſeconds of each degree in the quadrant; as alſo, for the ſines of the firſt 72 minutes to every ſingle ſecond: with other uſeful and neceſſary tables;" namely, a table of Logiſtical Logarithms, and three ſmaller tables to be uſed for finding the logarithms of numbers to twenty places of figures. Of theſe tables of Gardiner, only a ſmall number was printed, and that by ſubſcription; and they are now in the higheſt eſtimation of any logarithms for their accuracy and uſefulneſs.

An edition of Gardiner's collection was alſo elegantly printed at Avignon in France, in 1770, with ſome additions, namely, the ſines and tangents for every ſingle ſecond in the firſt four degrees, and a ſmall table of hyperbolic logarithms copied from a treatiſe on Fluxions by the late ingenious Mr. Thomas Simpſon: but this is not quite ſo correct as Gardiner's own edition. The tables in all theſe books are to ſeven places of figures.

"The logarithmic canon ſerves to find readily the logarithm of any aſſigned number; and we are told by Dr. Wallis, in the ſecond volume of his Mathematical Works, that an antilogarithmic canon, or one to find as readily the number correſponding to every logarithm, was begun he thinks by Mr. Harriot the algebraiſt (who died in 1621) and completed by Mr. Walter Warner, the editor of Harriot's works, before

before 1640; which ingenious performance it ſeems was loſt, for want of encouragement to publiſh it."

"A ſmall ſpecimen of ſuch numbers was publiſhed in the Philoſophical Tranſactions, for the year 1714, by Mr. Long of Oxford; but it was not till 1742 that a complete antilogarithmic canon was publiſhed, by Mr. James Dodſon, wherein he has computed the numbers correſponding to every logarithm from 1 to 100000, to 11 places of figures."

Since the preceding account was written, and whilſt it was in the preſs, there has been printed at Paris, "Tables Portatives de Logarithmes, publiées a Londres par Gardiner," &c. This work is moſt beautifully printed in a neat portable 8vo volume, and contains all the tables in Gardiner's 4to. volume, with ſome additions and improvements. But with what degree of accuracy remains yet to be determined. And on this, as well as ſeveral other occaſions, it is but juſtice to remark the extraordinary ſpirit and elegance with which the learned men and the artiſans of the French nation undertake and execute works of merit.

THE CONSTRUCTION OF LOGARITHMS, &c.

HAVING deſcribed the ſeveral ſorts of logarithms, their riſe and invention, their nature and properties, and given ſome account of the principal early cultivators of them, with the chief collections that have been publiſhed of ſuch tables; I proceed now to deliver a more particular account of the ideas and methods employed by each author, and the peculiar modes of conſtruction which they made uſe of.

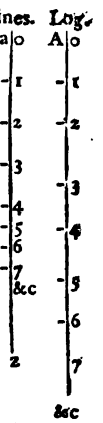
And firſt of the great inventor himſelf, lord Napier.

Napier's Conſtruction of Logarithms.

The inventor of logarithms did not adapt them to the ſeries of natural numbers 1, 2, 3, 4, 5, &c, as it was not his principal idea to extend them to all arithmetical operations whatever; but he confined his labours to that circumſtance which firſt ſuggeſted the neceſſity of the invention, and adapted his logarithms to the approximate numbers expreſſing the natural ſines of every minute in the quadrant, as they had been ſet down by former writers on trigonometry.

The ſame reſtricted idea was purſued through his method of conſtructing the logarithms. As the lines of the ſines of all arcs, are parts of the radius, or ſine of the quadrant, therefore called the *ſinus totus* or whole ſine, he conceived the line of the radius to be deſcribed, or run over, by a point moving along it in ſuch manner, that in equal portions of time it generated, or cut off, parts in a decreaſing geometrical progreſſion, leaving the ſeveral remainders, or ſines, in geometrical progreſſion alſo; whilſt another point, in an indefinite line, deſcribed equal parts of *it* in the ſame equal portions of time; ſo that the reſpective ſums of theſe, or the whole line generated, were always the arithmeticals or

logarithms of thoſe lines. Thus, az is the given radius upon which all the lines are to be taken, and A&c the indefinite line containing the logarithms; theſe lines being each generated by the motion of a point, beginning at A, a. Now at the end of the 1ſt, 2d, 3d, &c, moments, or equal ſmall portions of time, let the moving points be found at the places marked 1, 2, 3, &c; then za, z1, z2, z3, &c, will be the ſeries of natural lines, and Ao (or o), A1, A2, A3, &c, will be their logarithms; ſuppoſing the point which generates az to move every where with a velocity decreaſing in proportion to its diſtance from z, namely, its velocity in the points o, 1, 2, 3, &c, to be reſpectively as the diſtances zo, z1, z2, z3, &c, whilſt the velocity of the point generating the logarithmic line A&c, remains conſtantly the ſame as at firſt in the point A or o.



Hitherto the author had not fully limited his ſyſtem or ſcale of logarithms, having only ſuppoſed one condition or limitation, namely, that the logarithm of the radius az ſhould be o. But two independant conditions, no matter what they are, were neceſſary to limit the ſcale or ſyſtem of logarithms. It did not occur to him, that it was proper to form the other limit by affixing ſome particular value to an aſſigned number, or part of the radius: but as another condition was neceſſary, he aſſumed *this* for it, namely, that the two generating points ſhould begin to move at a, A with equal velocities; or that the increments a1, A1, deſcribed in the firſt moments, ſhould be equal; as he thought this circumſtance would be attended with ſome little eaſe in the computation. And this is the reaſon that, in his table, the natural lines and their logarithms, at the compleat quadrant, have equal differences; and this is alſo the reaſon why his ſcale of logarithms happens accidentally to agree with what have ſince been called the hyperbolic logarithms, which have numerical differences equal to thoſe of their natural numbers at the beginning; except only that theſe latter increaſe with the natural numbers, and his on the contrary decreaſe; the logarithms of the ratio of 10 to 1 being the ſame in both, namely 2·30258509.

And here by the way it may be obſerved, that Napier's manner of conceiving the generation of the lines of the natural numbers and their logarithms, by the motion of points, is very ſimilar to the manner in which Newton afterwards conſidered the generation of magnitudes in his doctrine of fluxions; and it is alſo remarkable that, in art. 2. of the *Habitudines Logarithmorum & ſuorum naturalium numerorum invicem* in the appendix to the *Conſtructio Logarithmorum*, Napier ſpeaks of the velocities of the increments or decrements of the logarithms, in the ſame way as Newton does, namely of his fluxions, where he ſhews that thoſe velocities, or fluxions, are inverſely as the lines or natural numbers of the logarithms; which is a neceſſary conſequence of the nature of the generation of thoſe lines as deſcribed above; with this alteration however, that now the radius az muſt be conſidered as generated by an equable motion of the point, and the indefinite line A &c by a motion increaſing in the ſame ratio as the other

other before decreaſed; which is a ſuppoſition that Napier muſt have had in view when he ſtated that relation of the fluxions.

Having thus limited his ſyſtem, Napier proceeds, in the poſthumous work of 1619, to explain his conſtruction of the logarithmic canon; and this he effects in various ways, but chiefly by generating, in a very eaſy manner, a ſeries of proportional numbers and their arithmeticals, or logarithms; and then finding, by proportion, the logarithms to the natural ſines, from thoſe of the neareſt numbers among the original proportionals.

After deſcribing the neceſſary cautions he made uſe of to preſerve a ſufficient degree of accuracy, in ſo long and complex a proceſs of calculation; ſuch as annexing ſeveral ciphers, as decimals ſeparated by a point to his primitive numbers, and rejecting the decimals thence reſulting after the operations were compleated, ſetting the numbers down to the neareſt unit in the laſt figure; and teaching the arithmetical proceſſes of adding, ſubtracting, multiplying, and dividing the limits between which certain unknown numbers muſt lie, ſo as to obtain the limits between which the reſults muſt alſo fall; I ſay, after deſcribing ſuch particulars, in order to clear and ſmooth the way, he enters on the great field of calculation itſelf. Beginning at radius 10000000, he firſt conſtructs ſeveral deſcending geometrical ſeries, but of ſuch a nature that they are all quickly formed by an eaſy continual ſubtraction, and a diviſion by 2, or by 10, or 100, &c, which is done by only removing the decimal point ſo many places towards the left hand, as there are ciphers in the diviſor. He conſtructs three tables of ſuch ſeries: The firſt of theſe conſiſts of 100 numbers, in the proportion of radius to radius minus 1, or of 10000000 to 9999999; all which are found by only ſubtracting from each its 10000000th part, which part is alſo found by only removing each figure 7 places lower: the laſt of theſe 100 proportionals is found to be 9999900·0004950.

The 2nd table contains 50 numbers, which are in the continual proportion of the firſt to the laſt in the firſt table, namely, of 10000000.0000000 to 9999900.0004950, or nearly the proportion of 100000 to 99999; theſe therefore are found by only removing the figures of each number 5 places lower, and ſubtracting them from the ſame number: the laſt of theſe he finds to be 9995001.222927. And a ſpecimen of theſe two tables is here annexed.

No.	Firſt Table.	2d Table.
1	10000000.0000000	10000000.000000
2	9999999.0000000	9999900·000000
3	9999998.0000001	9999800·001000
4	9999997.0000003	9999700·003000
&c	&c till the 100th	&c to the 50th term
50	term, which will be	9995001.222927
100	9999900.0004950	

The 3d table conſiſts of 69 columns, and each column of twenty-one numbers or terms, which terms, in every column, are in the continual proportion of 10000 to 9995, that is, nearly as the firſt is to the laſt in the 2d table; and as 10000 exceeds 9995 by the 2000th part, the terms in every column will be conſtructed by dividing each upper number by 2, removing the figures of the quotient 3 places lower, and then ſubtracting them; and in this way it is proper to conſtruct only the firſt column of 21 numbers, the laſt of which will be

 9900473·5780;

9900473.5780: but the 1ſt, 2d, 3d, &c, numbers in all the columns, are in the continual proportion of 100 to 99, or nearly the proportion of the firſt to the laſt in the firſt column; and therefore theſe will be found by removing the figures of each preceding number 2 places lower, and ſubtracting them, for the like number in the next column. A ſpecimen of this 3d table is as here below.

The 3d Table.

Terms	1ſt Column.	2nd Column.	3d Column.	&c till the	69 Column.
1	10000000.0000	9900000.0000	9801000.0000	&c for the	5048858.8900
2	9995000.0000	9895050.0000	9796099.5000	4th, 5th, 6th,	5046334.4605
3	9990002.5000	9890102.4750	9791201.4503	7th, &c col.	5043811.2932
4	9985007.4987	9885157.4237	9786305.8495	till the laſt	5041289.3879
5	9980014.9950	9880214.8451	9781412.6967	or	5038768.7435
&c	&c till	&c	&c		&c
21	9900473.5780	9801468.8423	9703454.1539		4998609.4034

Thus he had, in this 3d table, interpoſed between the radius and its half, 68 numbers in the continual proportion of 100 to 99; and interpoſed between every two of theſe 20 numbers in the proportion of 10000 to 9995: and again, in the 2d table, between 10000000 and 9995000, the two firſt of the 3d table, he had 50 numbers in the proportion of 100000 to 99999: And laſtly, in the 1ſt table, between 10000000 and 9999900, or the 2 firſt of the 2d table, 100 numbers in the proportion of 10000000 to 9999999. That is, in all about 1600 proportionals; all found in the moſt ſimple manner by little more than eaſy ſubtractions; which proportionals nearly coincide with all the natural ſines from 90° down to 30°.

To obtain the logarithms of all thoſe proportionals, he demonſtrates ſeveral properties and relations of the numbers and logarithms, and illuſtrates the manner of applying them. The principal of theſe properties are as follows: 1ſt, that the logarithm of any ſine is greater than the difference between that ſine and the radius, but leſs than the ſaid difference when increaſed in the proportion of the ſine to radius *; and 2dly, that the difference between the logarithms of two ſines, is leſs than the difference of the ſines increaſed in the proportion of the leſs ſine to radius, but greater than the ſaid difference of the ſines increaſed in the proportion of the greater ſine to radius †.

* By this firſt theorem, r being radius, the logarithm of the ſine s, is between $r-s$ and $\frac{r-s}{s}r$; and therefore, when s differs but little from r, the logarithm of s will be nearly equal to $\frac{\overline{r+s}\times\overline{r-s}}{2s}$, the arithmetical mean between the limits $r-s$ and $\frac{r-s}{s}r$; but ſtill nearer to $\overline{r-s}\sqrt{\frac{r}{s}}$ or $\frac{r-s}{s}\sqrt{rs}$, the geometrical mean between the ſaid limits.

† By this ſecond theorem, the difference between the logarithms of the two ſines S and s, lying between the limits $\frac{S-s}{s}r$ and $\frac{S-s}{S}r$, will, when thoſe ſines differ but little, be nearly equal to $\frac{S^2-s^2}{2Ss}r$ or $\frac{\overline{S+s}\times\overline{S-s}}{2Ss}r$, their arithmetical mean; or nearly $=\frac{S-s}{\sqrt{Ss}}r$, the geometrical mean; or nearly $=\frac{S-s}{S+s}2r$, by ſubſtituting, in the laſt denominator, $\frac{1}{2}\cdot\overline{S+s}$ for $\sqrt{Ss}$, to which it is nearly equal.

Hence,

Hence, by the 1ſt theorem, the logarithm of 10000000, the radius or firſt term in the firſt table, being 0, the logarithm of 9999999, the 2d term, will be between 1 and 1.0000001, and will therefore be equal to 1·00000005 very nearly: and this will be alſo the common difference of all the terms or proportionals in the firſt table; and therefore by the continual addition of this logarithm, there will be obtained the logarithms of all theſe 100 proportionals: conſequently 100 times the ſaid firſt logarithm, or the laſt of the above ſums, will give 100.000005, for the logarithm of 9999900.0004950, the laſt of the ſaid 100 proportionals.

Then, by the 2d theorem, it eaſily appears that .0004950 is the difference between the logarithms of 9999900.0004950 and 9999900, the laſt term of the firſt table and the 2d term of the ſecond table; this then being added to the laſt logarithm, gives 100.0005000 for the logarithm of the ſaid 2d term, as alſo the common difference of the logarithms of all the proportionals in the 2d table; and therefore by continually adding it, there will be generated the logarithms of all theſe proportionals in the 2d table; the laſt of which is 5000.025, anſwering to 9995001.222927 the laſt term of that table.

Again, by the 2d theorem, the difference between the logarithms of this laſt proportional of the 2d table, and the 2d term in the firſt column of the 3d table, is found to be 1.2235387; which being added to the laſt logarithm, gives 5001.2485387 for the logarithm of 9995000, the ſaid 2d term of the 3d table, as alſo the common difference of the logarithms of all the proportionals in the firſt column of that table; and this therefore, being continually added, gives all the logarithms of that firſt column, the laſt of which is 100024.97077, the logarithm of 9900473.5780, the laſt term of the ſaid column.

Finally, by the 2d theorem again, the difference between the logarithms of this laſt number and 9900000, the firſt term in the 2d column, is 478.3502; which being added to the laſt logarithm, gives 100503.3210 for the logarithm of the ſaid firſt term in the 2d column, as well as the common difference of the logarithms of all the numbers on the ſame line in every line of the table, namely, of all the 1ſt terms, of all the 2d, of all the 3d, of all the 4th, &c, terms in all the columns; and which therefore, being continually added to the logarithms in the firſt column, will give the correſponding logarithms in all the other columns.

And thus is compleated what the author calls the radical table, in which he retains only one decimal place in the logarithms (or *artificials*, as he always calls them in his tract on the conſtruction), and four in the naturals. A ſpecimen of the table is as here follows.

Radical Table.

Terms	1ſt Column.		2d Column.		69th Column.	
	Naturals.	Artifici.	Naturals.	Artifici.	Naturals.	Artificials
1	10000000.0000	0	9900000.0000	100503.3	5048858.8900	6834225.8
2	9995000.0000	5001.2	9895050.0000	105504.6	5046333.4605	6839227.1
3	9990002.5000	10002.5	9890102.4750	110505.8	5043811.2932	6844228.3
4	9985007.4987	15003.7	9885157.4237	115507.1	5041289.3879	6849229.6
5	9980014.9950	20005.0	9880214.8451	120508.3	5038768.7435	6854230.8
&c	&c till	&c	&c	&c	&c	&c
21	9900473.5780	100025.0	9801468.8423	200528.2	4998609.4034	6934250.8

Having

Having thus, in the moſt eaſy manner, compleated the radical table, by little more than mere addition and ſubtraction, both for the natural numbers and logarithms; the logarithmic ſines were eaſily deduced from it by means of the 2d theorem, namely, taking the ſum and difference of each tabular ſine and the neareſt number in the radical table, annex 7 ciphers to the difference, divide the reſult by the ſum, and half the quotient will be the difference between the logarithms of the ſaid numbers, namely, between the tabular ſine and radical number; conſequently, adding or ſubtracting this difference, to or from the given logarithm of the radical number, there will be obtained the logarithmic ſine required. And thus the logarithms of all the ſines from radius to the half of it, or from 90° to 30°, were perfected.

Next, for determining the ſines of the remaining 30 degrees, he delivers two methods. In the firſt of theſe he proceeds in this manner: Obſerving that the logarithm of the ratio of 2 to 1, or of half the radius, is 6931469.22, of 4 to one is the double of this, of 8 to 1 is triple of it, &c; that of 10 to 1 is 23025842.34, of 20 to 1 is the ſum of the logarithms of 2 and 10, and ſo on by compoſition for the logarithms of the ratios between 1 and 40, 80, 100, 200, &c, to 10000000; he multiplies any given ſine, for an arc leſs than 30 degrees, by ſome of theſe numbers, till he finds the product nearly equal to one of the tabular numbers; then by means of this and the ſecond theorem, the logarithms of this product is found; to which adding the logarithm that anſwers to the multiple abovementioned, the ſum is the logarithm ſought. But the other method is ſtill much eaſier, and is derived from this property, which he demonſtrates, namely, as half radius is to the ſine of half an arc, ſo is the coſine of the ſaid half arc to the ſine of the whole arc; or as $\frac{1}{2}$ radius : ſine of an arc :: coſine of the arc : ſine of double the arc; hence the logarithmic ſine of an arc is found, by adding together the logarithms of half radius and of the ſine of the double arc, and then ſubtracting the logarithmic coſine from the ſum.

And thus the remainder of the ſines, from 30° down to 0, are eaſily obtained. But in this latter way, the logarithmic ſines for full one half of the quadrant, or from 0 to 45 degrees, he obſerves, may be derived; the other half having already been made by the general method of the radical table, by one eaſy diviſion and addition or ſubtraction for each.

I have dwelt the longer on this work of the inventor of logarithms, becauſe I have not ſeen in any author an account of his method of conſtructing his table, although it is perfectly different from any other method uſed by the later computers, and indeed almoſt peculiar to his ſpecies of logarithms. The whole of this work manifeſts great ingenuity in the deſigner, as well as much accuracy. But notwithſtanding the caution he took to obtain his logarithms true to the neareſt unit in the laſt figure ſet down in the tables, by extending the numbers in the computations to ſeveral decimals, and other means; he had been diſappointed of that end, either by the inaccuracy of his aſſiſtant computers or tranſcribers, or through ſome other cauſe; as the logarithms in the table are commonly very inaccurate. It is remarkable

markable too that in this tract on the conſtruction of the logarithms, Lord Napier never calls them logarithms, but every where *artificials*, as oppoſed in idea to the natural numbers: and this notion of natural and artificial numbers I take to have been his firſt idea of this matter, and that he altered the word *artificials* to *logarithms* in his firſt book, on the deſcription of them, when he printed it, in the year 1614, and that he would alſo have altered the word every where in this poſthumous work if he had lived to print it: for in the two or three pages of appendix, annexed to the work by his ſon from Napier's papers, he again always calls them logarithms. This appendix relates to the change of the logarithms to that ſcale in which 1 is the logarithm of the ratio of 10 to 1, the logarithm of 1, with or without ciphers, being 0; and it appears to have been written after Briggs communicated to him his idea of that change.

Napier here in this appendix alſo briefly deſcribes ſome methods by which this new ſpecies of logarithms may be conſtructed. Having ſuppoſed 0 to be the logarithm of 1, and 1 with any number of ciphers, as 10000000000, the logarithm of 10; he directs to divide this logarithm of 10, and the ſucceſſive quotients, ten times by 5, by which diviſions there will be obtained theſe other ten logarithms, namely 2000000000, 400000000, 80000000, 16000000, 3200000, 640000, 128000, 25600, 5120, 1024: then this laſt logarithm, and its quotients, being divided ten times by 2, will give theſe other ten logarithms 512, 256, 128, 64, 32, 16, 8, 4, 2, 1. And the numbers anſwering to theſe twenty logarithms, we are directed to find in this manner; namely, extract the 5th root of 10 (with ciphers), then the 5th root of that root; and ſo on for ten continual extractions of the 5th root; ſo ſhall theſe ten roots be the natural numbers belonging to the firſt ten logarithms, above found in continually dividing by 5: Next, out of the laſt 5th root we are to extract the ſquare root, then the ſquare root of this laſt root, and ſo on for ten ſucceſſive extractions of the ſquare root; ſo ſhall theſe laſt ten roots be the natural numbers correſponding to the logarithms or quotients ariſing from the laſt ten diviſions by the number 2. And from theſe twenty logarithms, 1, 2, 4, 8, 16, &c, and their natural numbers, the author obſerves that other logarithms and their numbers may be formed, namely by adding the logarithms and multiplying their correſpondent numbers. It is evident that this proceſs would generate rather an antilogarithmic canon, ſuch as Dodſon's, than the table of Briggs; and that the method would alſo be very laborious, ſince, beſides the very troubleſome original extractions of the 5th roots, all the numbers would be very large, by the multiplication of which the ſucceſſive ſecondary natural numbers are to be found.

Our author next mentions another method of deriving a few of the primitive numbers and their logarithms, namely, by taking continually geometrical means, firſt between 10 and 1, then between 10 and this mean, and again between 10 and the laſt mean, and ſo on; and taking the arithmetical means between their correſponding logarithms. He then lays down various relations between numbers and their logarithms, ſuch as that the products and quotients of numbers, anſwer to the ſums and differences of their logarithms; and that the powers and roots of numbers,

numbers, anſwer to the products and quotients of the logarithms by the index of the power or root, &c; as alſo that, of any two numbers, whoſe logarithms are given, if each number be raiſed to the power denoted by the logarithm of the other, the two reſults will be equal. He then delivers another method of making the logarithms to a few of the prime integer numbers, which is well adapted for conſtructing the common table of logarithms. This method eaſily follows from what has been ſaid above, and it depends on this property, that the logarithm of any number in this ſcale, is 1 leſs than the number of places or figures contained in that power of the given number whoſe exponent is 10000000000 or the logarithm of 10, at leaſt as to integer numbers, for they really differ by a fraction, as is ſhewn by Mr. Briggs in his illuſtrations of theſe properties, printed at the end of this appendix to the conſtruction of logarithms. I ſhall here ſet down one more of theſe relations, as the manner in which it is expreſſed is exactly ſimilar to that of fluxions and fluents, and it is this: Of any two numbers, as the greater is to the leſs, ſo is the velocity of the increment or decrement of the logarithms at the leſs, to the velocity of the increment or decrement of the logarithms at the greater: that is, in our modern notation, as $X : Y :: \dot{y}$ to $\dot{x}$, where $\dot{x}$ and $\dot{y}$ are the fluxions of the logarithms of X and Y.

Kepler's Conſtruction of Logarithms.

The logarithms of Briggs and Kepler were both printed the ſame year, 1624; but as the latter are of the ſame ſort as Napier's, I ſhall here give the author's conſtruction of them, before we proceed to that of Briggs's.

We have already (pa. 31 *& ſeq.*) deſcribed the nature and form of Kepler's logarithms, ſhewing that they are of the ſame kind as Napier's, but only a little varied in the form of the table. It may alſo be added that, in general, the ideas which theſe two maſters had on this ſubject, were of the ſame nature, only it was more fully and methodically laid down by Kepler, who expanded, and delivered in a regular ſcience, the hints that were given by the illuſtrious inventor. The foundation and nature of their methods of conſtruction, are alſo the ſame, but only a little varied in their modes of applying them. Kepler here firſt of any treats of logarithms in the true and genuine way of the meaſures of ratios, or proportions *, as he calls them, and that in a very full and ſcientific manner: and this method of his was afterwards followed and abridged by Mercator, Halley, Cotes, and others, as we ſhall ſee in the proper places. Kepler firſt erects a regular and purely mathematical ſyſtem of proportions, and the meaſures of proportions,

* Kepler almoſt always uſes the term *proportion* inſtead of *ratio*, which I alſo ſhall do in my account of his work, as well as conform in expreſſions and notations to his other peculiarities. It may alſo be here remarked, that I obſerve the ſame practice in deſcribing the works of other authors, the better to convey the idea of their ſeveral methods and ſtile. And this may ſerve to account for ſome ſeeming inequalities in the language of this hiſtory.

treated

treated at conſiderable length in a number of propoſitions, which are fully and chaſtely demonſtrated by genuine mathematical reaſoning, and illuſtrated by numerical examples. This part contains and demonſtrates both the nature and the principles of the ſtructure of logarithms. And in the ſecond part he applies thoſe principles in the actual conſtruction of his table, which contains only 1000 numbers and their logarithms, in the form as we before deſcribed: and in this part he indicates the various contrivances made uſe of in deducing the logarithms of proportions one from another, after a few of the leading ones had been firſt formed by the general and more remote principles. He uſes the name *logarithms*, given them by the inventor, being the moſt proper, as expreſſing the very nature and eſſence of thoſe artificial numbers, and containing as it were a definition in the very name of them; but without taking any notice of the inventor, or of the origin of thoſe uſeful numbers.

As this tract is very curious and important in itſelf, and is beſides very rare and little known, inſtead of a particular deſcription only, I ſhall here give a brief tranſlation of both the parts, omitting only the demonſtrations of the propoſitions, and ſome rather long illuſtrations of them.

The book is dedicated to Philip, landgrave of Heſſe, but is without either preface or introduction, and commences immediately with the ſubject of the firſt part, which is intituled *The Demonſtration of the Structure of Logarithms*; and the contents of it are as follows.

Poſtulate 1. That all proportions equal among themſelves, by whatever variety of couplets of terms they may be denoted, are meaſured or expreſſed by the ſame quantity.

Axiom 1. If there be any number of quantities of the ſame kind, the proportion of the extremes is underſtood to be compoſed of all the proportions of every adjacent couplet of terms, from the firſt to the laſt.

1 *Propoſition*. The mean proportional between two terms divides the proportion of thoſe terms into two equal proportions.

Axiom 2. Of any number of quantities, regularly increaſing the means divide the proportion of the extremes into one proportion more than the number of the means.

Poſtulate 2. That the proportion between any two terms, is diviſible into any number of parts, until thoſe parts become leſs than any propoſed quantity.

An example of this ſection is then inſerted in a ſmall table, in dividing the proportion which is between 10 and 7 into 1073741824 equal parts, by as many mean proportionals wanting one, namely, by taking the mean proportional between 10 and 7, then the mean between 10 and this mean, and the mean between 10 and the laſt, and ſo on for 30 means, or 30 extractions of the ſquare root, the laſt or 30th of which roots is 9999999996678056900 and the 30th power of 2, which is 1073741824, ſhews into how many parts the proportion between 10 and 7, or between 1000 &c and 700 &c, is divided by 1073741824 means each of which parts is equal to the proportion between 1000 &c, and the 30th mean 999 &c. that is the proportion between 1000 &c and 999 &c, is the 1073741824th part of the proportion between 10 and 7. Then by aſſuming the ſmall difference 00000.00003.32179.43100, for the meaſure of the very ſmall element of the proportion of 10 to 7, or for the meaſure of the proportion of 1000 &c to 999 &c, or for the logarithm of this laſt term, and multiplying it by 1073741824, the number of parts, the product will give 35667.49481 37822.14400 for the logarithm of the leſs term 7 or 700 &c.

Poſtulate 3. That the extremely ſmall quantity or element of a proportion, may be meaſured or denoted by any quantity whatever; as for inſtance, by the difference of the terms of that element.

2 *Propoſition.* Of three continued proportionals, the difference of the two firſt has to the difference of the two latter, the ſame proportion which the firſt term has to the 2d, or the 2d to the 3d.

3 *Prop.* Of any continued proportionals, the greateſt terms have the greateſt difference, and the leaſt terms the leaſt.

4 *Prop.* In any continued proportionals, if the difference of the greateſt terms be made the meaſure of the proportion between *them*, the difference of any other couplet will be leſs than the true meaſure of *their* proportion.

5 *Prop.* In continued proportionals, if the difference of the greateſt terms be made the meaſure of their proportion, then the proportion of the greateſt to any other term will be greater than *their* difference.

6 *Prop.* In continued proportionals, if the difference of the greateſt term and any one of the leſs, taken not immediately next to it, be made the meaſure of their proportion; then the proportion which is between the greateſt and any other term greater than the one before taken, will be leſs than the difference of thoſe terms; but the proportion which is between the greateſt term and any one leſs than that firſt taken, will be greater than their difference.

7 *Prop.* Of any quantities placed according to the order of their magnitudes, if any two ſucceſſive proportions be equal, the three ſucceſſive terms which conſtitute them, will be continued proportionals.

8 *Prop.* Of any quantities placed in the order of their magnitudes, if the intermediates lying between any two terms, be not among the mean proportionals which can be interpoſed between the ſaid two terms, then ſuch intermediates do not divide the proportion of thoſe two terms into commenſurable proportions.

Beſides the demonſtrations, as uſual, ſeveral definitions are here given; as of commenſurable proportions, &c.

9 *Prop.* When two expreſſible lengths are not to one another as two figurate numbers of the ſame ſpecies, ſuch as two ſquares, or two cubes; there cannot fall between them other expreſſible lengths, which ſhall be mean proportionals, and as many in number as that ſpecies requires, namely, one in the ſquares, two in the cubes, three in the biquadrats, &c.

10 *Prop.* Of any expreſſible quantities, following in the order of their magnitudes, if the two extremes be not in the proportion of two ſquare numbers, or two cubes, or two other powers of the ſame kind; none of the intermediates divide the proportion into commenſurables.

11 *Prop.* All the proportions, taken in order, which are between expreſſible terms that are in arithmetical proportion, are incommenſurable to one another. As between 8, 13, 18.

12 *Prop.* Of any quantities placed in the order of magnitude, if the difference of the greateſt terms be made the meaſure of their proportion, then the difference between any two others will be leſs than the meaſure of *their* proportion; and if the difference of the two leaſt terms be made the meaſure of their proportion, then the differences of

the

the reſt will be greater than the meaſure of the proportion between their terms.

Corol. If the meaſure of the proportion between the greateſt, exceed their difference, then the proportion of this meaſure to the ſaid difference, will be leſs than that of a following meaſure to the difference of its terms. Becauſe proportionals have the ſame ratio.

13 *Prop.* If three quantities follow one another in the order of magnitude; the proportion of the two laſt will be contained in the proportion of the extremes, a leſs number of times than the difference of the two leaſt is contained in the difference of the extremes: And on the contrary, the proportion of the two greateſt will be contained in the proportion of the extremes, oftener than the difference of the former is contained in that of the latter.

Corol. Hence if the difference of the two greater be equal to the difference of the two leſs terms, the proportion between the two greater will be leſs than the proportion between the two leſs.

14 *Prop.* Of three equidifferent quantities taken in order, the proportion between the extremes is more than double the proportion between the two greater terms.

Corol. Hence it follows, that half the proportion of the extremes, is greater than the proportion of the two greateſt terms, but leſs than the proportion of the two leaſt.

15 *Prop.* If two quantities conſtitute a proportion, and each quantity be leſſened by half the greater; the remainders will conſtitute a proportion greater than double the former.

16 *Prop.* The aliquot parts of incommenſurable proportions, are incommenſurable to each other.

17 *Prop.* If one thouſand numbers follow one another in the natural order, beginning at 1000, and differing all by unity, viz. 1000, 999, 998, 997, &c; and the proportion between the two greateſt 1000, 999, by continual biſection, be cut into parts that are ſmaller than the exceſs of the proportion between the next two 999, 998, over the ſaid proportion between the two greateſt 1000, 999; and then for the meaſure of that ſmall element of the proportion between 1000, 999, there be taken the difference of 1000 and that mean proportional which is the other term of the element. Again, if the proportion between 1000, 998 be likewiſe cut into double the number of parts which the former proportion between 1000, 999 was cut into; and then for the meaſure of the ſmall element in this diviſion, be taken the difference of its terms, of which the greater is 1000. And, in the ſame manner, if the proportion of 1000 to the following numbers, as 997, &c, by continual biſection, be cut into particles of ſuch magnitude, as may be between $\frac{3}{4}$ and $\frac{1}{4}$ of the element ariſing from the ſection of the firſt proportion between 1000 and 999; the meaſure of each element will be given from the difference of its terms. Then, this being done, the meaſure of any one of the 1000 proportions, will be compoſed of as many meaſures of its element, as there are of thoſe elements in the ſaid divided proportion. And all theſe meaſures, for all the proportions, will be ſufficiently exact for the niceſt calculations.

All theſe ſections and meaſures of proportions are performed in the manner of that deſcribed at poſtulate 2, and the operation is abundantly explained by numerical calculations.

18 *Prop.* The proportion of any number to the firſt term 1000 being known; there will alſo be known the proportion of the reſt of the numbers in the ſame continued proportion, to the ſaid firſt term.

So from the known proportion between 1000 and 900,
there is alſo known the proportion of 1000 to 810, and to 729;
And from 1000 to 800, alſo 1000 to 640, and to 512;
And from 1000 to 700, alſo 1000 to 490, and to 343;
And from 1000 to 600, alſo 1000 to 360, and to 216;
And from 1000 to 500, alſo 1000 to 250, and to 125.

Corol. Hence ariſes the precept for ſquaring, cubing, &c; as alſo for extracting the ſquare root, cube root, &c, out of the firſt figures of numbers. For it will be, as the greateſt number of the chiliad as a denominator, is to the number propoſed as a numerator, ſo is this to the ſquare of the fraction, and ſo is this to the cube.

19 *Prop.* The proportion of a number to the firſt, or 1000, being known; if there be two other numbers in the ſame proportion to each other, then the proportion of one of theſe to 1000 being known, there will alſo be known the proportion of the other to the ſame 1000.

Corol. 1. Hence from the 15 proportions mentioned in prop. 18, will be known 120 others below 1000, to the ſame 1000.

For ſo many are the proportions, equal to ſome one or other of the ſaid 15, that are among the other integer numbers which are leſs than 1000.

Corol. 2. Hence ariſes the method of treating the Rule-of-Three, when 1000 is one of the given terms.

For this is effected by adding to, or ſubtracting from, each other, the meaſures of the two proportions of 1000 to each of the other two given numbers, according as 1000 is, or is not, the firſt term in the Rule-of-three.

20 *Prop.* When four numbers are proportional, the firſt to the ſecond as the third to the fourth, and the proportions of 1000 to each of the three former are known, there will alſo be known the proportion of 1000 to the fourth number.

Corol. 1. By this means other chiliads are added to the former.

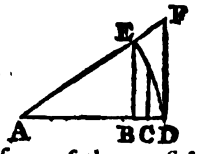
Corol. 2. Hence ariſes the method of performing the Rule-of-three, when 1000 is not one of the terms. Namely, from the ſum of the meaſures of the proportions of 1000 to the ſecond and third, take that of 1000 to the firſt, and the remainder is the meaſure of the proportion of 1000 to the fourth term.

Definition. The meaſure of the proportion between 1000 and any leſs number, as before deſcribed, and expreſſed by a number, is ſet oppoſite to that leſs number in the chiliad, and is called its LOGARITHM, that is, the number (αριθμὸς) indicating the proportion (λογον) which 1000 bears to that number, to which the logarithm is annexed.

21 *Prop.* If the firſt or greateſt number be made the radius of a circle, or *ſinus totus*; every leſs number, conſidered as the coſine of ſome arc, has a logarithm greater than the verſed ſine of that arc, but leſs than the difference between the radius and ſecant of the arc; except only in the term next after the radius, or greateſt term, the logarithm of which by the hypotheſis is made equal to the verſed ſine.

22. *Prop.*

That is, if C D be made the logarithm of A C, or the meaſure of the proportion of A C to A D; then the meaſure of the proportion of A B to A D, that is the logarithm of A B, will be greater than B D, but leſs than E F. And this is the ſame as Napier's firſt rule in page 44.



22. *Prop.* The ſame things being ſuppoſed; the ſum of the verſed ſine and exceſs of the ſecant over the radius, is greater than double the logarithm of the coſine of an arc.

Corol. The log. coſine is leſs than the arithmetic mean between the verſed ſine and the exceſs of the ſecant.

Precept 1. Any ſine being found in the canon of ſines, and its defect below radius to the exceſs of the ſecant above radius; then ſhall the logarithm of the ſine be leſs than half that ſum, but greater than the ſaid defect or coverſed ſine.

Let there be the ſine 99970.1490 of an arc:
Its defect below radius is 29.8510 the covers. and leſs than logarithm ſine;
Add the exceſs of the ſecant 29.8599
Sum 59.7109
its half or 29.8555 greater than the logarithm.
Therefore the logarithm is between { 29.8510 and 29.8555.

Precept 2. The logarithm of the ſine being found, you will alſo find nearly the logarithm of the round or integer number which is next leſs than your ſine with a fraction, by adding that fractional exceſs to the logarithm of the ſaid ſine.

Thus the logarithm of the ſine 99970.149 is found to be about 29.854; if now the logarithm of the round number 99970.000 be required, add 149 the fractional part of the ſine to its logarithm, obſerving the point, thus 29.854 } is the logarithm of the round number
149 } 999700.000 nearly.
the ſum 30.003

23. *Prop.* Of three equidifferent quantities, the meaſure of the proportion between the two greater terms, with the meaſure of the proportion between the two leſs terms, will conſtitute a proportion, which will be greater than the proportion of the two greater terms, but leſs than the proportion of the two leaſt.

Thus if AB, AC, AD be three quantities having the equal differences BC, CD; and if the meaſure of the proportion of AD, AC be cd, and that of AC, AB be bc; then the proportion of cd to cb will be greater than the proportion of AC to AD, but leſs than the proportion of AB to AC.

24 *Prop.* The ſaid proportion between the two meaſures, is leſs than half the proportion between the extreme terms. That is, the proportion between bc, cd, is leſs than half the proportion between AB, AD.

Corol. Since therefore the arithmetical mean divides the proportion into unequal parts, of which the one is greater, and the other leſs, than half the whole; if it be enquired what proportion is between theſe proportions, the anſwer is, that it is a little leſs than the ſaid half,

An

An Example of finding nearly the limits, greater and leſs, to the meaſure of any propoſed proportion.

It being known that the meaſure of the proportion between 1000 and 900 is 10536.05, required the meaſure of the proportion 900 to 800, where the terms 1000, 900, 800, have equal differences. Therefore as 9 to 10 ſo 10536.05 to 11706.72, which is leſs than 11778.30 the meaſure of the proportion 9 to 8. Again, as the mean proportional between 8 and 10 (which is 8.9442719) is to 10 ſo 10536.05 to 11779.66, which is greater than the meaſure of the proportion between 9 and 8.

Axiom. Every number denotes an expreſſible quantity.

25 *Prop.* If the 1000 numbers, differing by 1, follow one another in the natural order; and there be taken any two adjacent numbers, as the terms of ſome proportion; the meaſure of this proportion will be to the meaſure of the proportion between the two greateſt terms of the chiliad, in a proportion greater than that which the greateſt term 1000 bears to the greater of the two terms firſt taken, but leſs than the proportion of 1000 to the leſs of the ſaid two ſelected terms.

So of the 1000 numbers taking any two ſucceſſive terms, as 501 and 500, the logarithm of the former being 69114.92, and of the latter 69314.72, the difference of which is 199.80. Wherefore by the definition, the meaſure of the proportion between 501 and 500 is 199.80. In like manner, becauſe the logarithm of the greateſt term 1000 is 0, and of the next 999 is 100.05, the difference of theſe logarithms, and the meaſure of the proportion between 1000 and 999, is 100.05. Couple now the greateſt term 1000 with each of the ſelected terms 501 and 500; couple alſo the meaſure 199.80 with the meaſure 100.05; ſo ſhall the proportion between 199.80 and 100.05 be greater than the proportion between 1000 and 501, but leſs than the proportion between 1000 and 500.

Corol. 1. Any number below the firſt 1000 being propoſed, as alſo its logarithm; the differences of any logarithms antecedent to that propoſed, towards the beginning of the chiliad, are to the firſt logarithm (viz. that which is aſſigned to 999), in a greater proportion than 1000 to the number propoſed; but of thoſe which follow towards the laſt logarithm, they are to the ſame in a leſs proportion.

Corol. 2. By this means the places of the chiliad may eaſily be filled up, which have not yet had logarithms adapted to them by the former propoſitions.

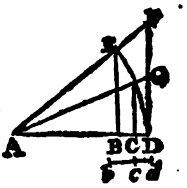
26 *Prop.* The difference of two logarithms, adapted to two adjacent numbers, is to the difference of theſe numbers, in a proportion greater than 1000 bears to the greater of thoſe numbers, but leſs than that of 1000 to the leſs of the two numbers.

This 26 prop. is the ſame as Napier's ſecond rule at page 44.

27 *Prop.* Having given two adjacent numbers of the 1000 natural numbers, with their logarithmic indices, or the meaſures of the proportions which thoſe abſolute or round numbers conſtitute with 1000 the greateſt; the increments or differences of theſe logarithms will be to the logarithm of the ſmall element of the proportions, as the ſecants of the arcs whoſe coſines are the two abſolute numbers, is to the greateſt number, or the radius of the circle: ſo that, however, of the ſaid two ſecants, the leſs will have to the radius a leſs proportion, than the propoſed difference has to the firſt of all, but the greater will have a greater proportion, and ſo alſo will the mean proportional between the ſaid ſecants have a greater proportion.

Thus

Thus if B C, C D be equal, alſo *b d* the logarithm of A B, and *c d* the logarithm of A C; then the proportion of *b c* to *c d* will be greater than the proportion of A G to A D, but leſs than that of A F to A D, and alſo leſs then that of the mean proportional between A F and A G to A D.



Corol. 1. The ſame obtains alſo when the two terms differ, not only by the unit of the ſmall element, but by another unit which may be ten fold, a hundred fold, or a thouſand fold of that.

Corol. 2. Hence the differences will be obtained ſufficiently exact, eſpecially when the abſolute numbers are pretty large, by taking the arithmetical mean between two ſmall ſecants, or (if you will be at the labour) by taking the geometrical mean between two larger ſecants, and then by continually adding the differences, the logarithms will be produced.

Corol. 3. *Precept.* Divide the radius by each term of the aſſigned proportion, and the arithmetical mean (or ſtill nearer the geometrical mean) between the quotients will be the required increment, which being added to the logarithm of the greater term, will give the logarithm of the leſs term.

Example.

Let there be given the logarithm of 700, viz. 35667.4948, to find the logarithm to 699.

Here radius divided by 700 gives 1428571 &c.
and divided by 699 gives 1430672 &c.
the arithmetic mean is 142.962
which added to 35667.4948
gives the logarithm to 699 35810.4568

Corol. 4. *Precept* for the logarithms of ſines.

The increment between the logarithms of two ſines, is thus found: find the geometrical mean between the coſecants, and divide it by the difference of the ſines, the quotient will be the difference of the logarithms.

Example.

0° 1′ ſine 2909 coſec.	343774682	The quotient 80000 exceeds the required increment of the logarithms, becauſe the ſecants are here ſo large.
9 2 ſine 5818 coſec.	171887319	
dif. 2909 geom. mean 2428 nearly.		

Appendix. Nearly in the ſame manner it may be ſhewn, that the ſecond differences are in the duplicate proportion of the firſt, and the third in the duplicate of the ſecond. Thus for inſtance, in the beginning of the logarithms the firſt difference is 100.00000, viz. equal to the difference of the numbers 100000.00000 and 99900.00000; the ſecond, or difference of the differences, 10000; the third 20. Again after arriving at the number 50000.00000, the logarithms have for a difference 200.00000, which is to the firſt difference, as the number 100000.00000 to 50000.00000; but the ſecond difference is 40000, in which 10000 is contained four times; and the third 328, in which 20 is contained ſixteen times. But ſince in treating of new matters we labour under the want of proper words, wherefore leaſt we ſhould become too obſcure, the demonſtration is omitted untried.

28 *Prop.*

28 *Prop.* No number expreſſes exactly the meaſure of the proportion, between two of the 1900 numbers, conſtituted by the foregoing method.

29 *Prop.* If the meaſures of all proportions be expreſſed by numbers or logarithms; all proportions will not have aſſigned to them their due portion of meaſure, to the utmoſt accuracy.

30 *Prop.* If to the number 1000, the greateſt of the chiliad, be referred others that are greater than it, and the logarithm of 1000 be made 0, the logarithms belonging to thoſe greater numbers will be negative.

This concludes the firſt or ſcientific part of the work, the principles of which Kepler applies, in the ſecond part, to the actual conſtruction of the firſt 1000 logarithms, which is pretty minutely deſcribed. This part is entituled *A very compendious method of conſtructing the Chiliad of Logarithms*; and it is not improperly ſo called, the method being very conciſe and eaſy. The fundamental principles are briefly theſe: That at the beginning of the logarithms, their increments or differences are equal to thoſe of the natural numbers: that the natural numbers may be conſidered as the decreaſing coſines of increaſing arcs: and that the ſecants of thoſe arcs at the beginning have the ſame differences as the coſines, and therefore the ſame differences as the logarithms. Then, ſince the ſecants are the reciprocals of the coſines, by theſe principles and the third corol. to the twenty-ſeventh propoſition, he eſtabliſhes the following method of conſtituting the 100 firſt or ſmalleſt logarithms to the 100 largeſt numbers, 1000, 999, 998, 997, &c to 900. viz. Divide the radius 1000, increaſed with ſeven ciphers, by each of theſe numbers ſeparately, diſpoſing the quotients in a table, and they will be the ſecants of thoſe arcs which have the diviſors for their coſines; continuing the diviſion to the 8th figure, as it is in that place only that the arithmetical and geometrical means differ. Then by adding ſucceſſively the arithmetical means between every two ſucceſſive ſecants, the ſums will be the ſeries of logarithms. Or by adding continually every two ſecants, the ſucceſſive ſums will be the ſeries of the double logarithms.

Beſides theſe 100 logarithms, thus conſtructed, he conſtitutes two others by continual biſection, or extractions of the ſquare root, after the manner deſcribed in the ſecond poſtulate. And firſt he finds the logarithm which meaſures the proportion between 100000.00 and 97656.25, which latter term is the third proportional to 1024 and 1000, each with two ciphers; and this is effected by means of twenty-four continual extractions of the ſquare root, determining the greateſt term of each of twenty-four claſſes of mean proportionals; then the difference between the greateſt of theſe means and the firſt or whole number 1000, with ciphers, being as often doubled, there ariſes 2371.6526 for the logarithm ſought, which made negative is the logarithm of 1024. Secondly, the like proceſs is repeated for the proportion between the numbers 1000 and 500, from which ariſes 69314.7193 for the logarithm of 500; which he alſo calls the logarithm of duplication, being the meaſure of the proportion of 2 to 1.

Then

Then from the foregoing he derives all the other logarithms in the chiliad, beginning with thoſe of the prime numbers 1, 2, 3, 5, 7, &c, in the firſt 100. And firſt, ſince 1024, 512, 256, 128, 64, 32, 16, 8, 4, 2, 1, are all in the continued proportion of 1000 to 500, therefore the proportion of 1024 to 1 is decuple of the proportion of 1000 to 500, and conſequently the logarithm of 1 would be decuple of the logarithm of 500, if 0 were taken as the logarithm of 1024; but ſince the logarithm of 1024 is applied negatively, the logarithm of 1 muſt be diminiſhed by as much: diminiſhing therefore 10 times the logarithm of 500, which is 693147.1928, by 2371.6526, the remainder 690775.5422 is the logarithm of 1, or of 190.00 what is ſet down in the table.

Nos.	Logarithms.
100	230258.5141
10	460517.0282
1	690775.5422
.1	921034.0563
.01	1151292.5703
.001	1381551.0844
.0001	1611809.5985

And becauſe 1, 10, 100, 1000, are continued proportionals, therefore the proportion of 1000 to 1 is triple of the proportion of 1000 to 100, and conſequently $\frac{1}{3}$ of the logarithm of 1 is to be put for the logarithm of 100, viz. 230258.5141, and this is alſo the logarithm of decuplication, or of the proportion of 10 to 1. And hence multiplying this logarithm of 100 ſucceſſively by 2, 3, 4, 5, 6, and 7, there ariſe the logarithms to the numbers in the decuple proportion, as in the margin.

Log. of 1	690775.5422
of 2 to 1	69314.7193
log. of 2	621460.8229
log. of 10	460517.0281
of 5 to 1	160943.7948
log. of 5	529831.7474

Alſo if the logarithm of duplication, or of the proportion of 2 to 1, be taken from the logarithm of 1, there will remain the logarithm of 2; and from the logarithm of 2 taking the logarithm of 10, there remains the logarithm of the proportion of 5 to 1; which taken from the logarithm of 1, there remains the logarithm of 5. See the margin.

For the logarithms of other prime numbers he has recourſe to thoſe of ſome of the firſt or greateſt century of numbers, before found, viz. of 999, 998, 997, &c. And firſt, taking 960, whoſe logarithm is 4082.2001; then by adding to this logarithm the logarithm of duplication, there will ariſe the ſeveral logarithms of all theſe numbers, which are in duplicate proportion continued from 960, namely 480, 240, 120, 60, 30, 15. Hence the logarithm of 30 taken from the logarithm of 10, leaves the logarithm of the proportion of 3 to 1; which taken from the logarithm of 1, leaves the logarithm of 3, viz. 580914.3106. And the double of this diminiſhed by the logarithm of 1, gives 471053.0790 for the logarithm of 9.

Next, from the logarithm of 990, or $9 \times 10 \times 11$, which is 1005.0331, he finds the logarithm of 11, namely, ſubtract the ſum of the logarithms of 9 & 10 from the ſum of the logarithm of 990 and double the logarithm of 1, there remains 450986.0106 the logarithm of 11.

Again, from the logarithm of 980, or $2 \times 10 \times 7 \times 7$, which is 2020.2711, he finds 496184.5228 for the logarithm of 7.

And from 5129.3303 the logarithm of 950 or $5 \times 10 \times 19$, he finds 396331.6392 for the logarithm of 19.

In like manner the logarithm

to 998 or 4 × 13 × 19, gives the logarithm of 13;
to 969 or 3 × 17 × 19, gives the logarithm of 17;
to 986 or 2 × 17 × 29, gives the logarithm of 29;
to 966 or 6 × 7 × 23, gives the logarithm of 23;
to 930 or 3 × 10 × 31, gives the logarithm of 31.

And ſo on for all the primes below 100, and for many of the primes in the other centuries up to 900. After which he directs to find the logarithms of all numbers compoſed of theſe, by the proper addition and ſubtraction of their logarithms, namely, in finding the logarithm of the product of two numbers, from the ſum of the logarithms of the two factors take the logarithm of 1, the remainder is the logarithm of the product. In this way he ſhews that the logarithms of all numbers under 500 may be derived, except thoſe of the following 36 numbers, namely 127, 149, 167, 173, 179, 211, 223, 251, 257, 263, 269, 271, 277, 281, 283, 293, 337, 347, 349, 353, 359, 367, 373, 379, 383, 389, 397, 401, 409, 419, 421, 431, 433, 439, 443, 449. Alſo beſides the compoſite numbers between 500 and 900, made up of the products of ſome numbers whoſe logarithms have been before determined, there will be 59 primes not compoſed of them; which with the 36 above mentioned, make 95 numbers in all not compoſed of the products of any before them, and the logarithms of which he directs to be derived in this manner; namely, by conſidering the differences of the logarithms of the numbers interſperſed among them; then by that method by which were conſtituted the differences of the logarithms of the ſmalleſt 100 numbers in a continued ſeries, we are to proceed here in the diſcontinued ſeries, that is, by prop. 27, corol. 3, and eſpecially by the appendix to it, if it be rightly uſed, from whence thoſe differences will be very eaſily ſupplied.

This cloſes the ſecond part, or the actual coſtruction of the logarithms; after which follows the table itſelf, which has been before deſcribed, pa. 31. Before I diſmiſs Kepler's work, however, it may not be improper in this place to take notice of an erroneous property laid down by him in the appendix to the 27th prop. juſt now referred to; both becauſe it is an error in principal, tending to vitiate the practice, and becauſe it ſerves to ſhew that Kepler was unacquainted with the true nature of the orders of differences of the logarithms, notwithſtanding what he ſays above with reſpect to the conſtruction of them by means of their ſeveral orders of differences, and that conſequently he has no legal claim to any ſhare in the diſcovery of the differential method, known at that time to Briggs, and it would ſeem to him alone, it being publiſhed in his logarithms in the ſame year 1624, as Kepler's book, together with the true nature of the logarithmic orders of differences, as we ſhall preſently ſee in the following account of his works. Now this error of Kepler's, here alluded to, is in that expreſſion where he ſays the third differences are in the *duplicate* ratio of the ſecond differences, like as the ſecond differences are in the duplicate ratio of the firſt; or, in other words, that the third differences are as the *ſquares* of the ſecond differences, as well as

the

the ſecond differences as the ſquares of the firſt; or that the third differences are as the *fourth powers* of the firſt differences. Whereas in truth the third differences are only as the *cubes* of the firſt differences. Kepler ſeems to have been led into this error by a miſtake in his numbers, viz. when he ſays in that appendix, that *the third difference is* 328, *in which* 20 *is contained* 16 *times*; for when the numbers are accurately computed, the third difference comes out only 161, in which therefore 20 is contained only 8 times, which is the cube of 2, the number of times the one firſt difference contains the other. It would hence ſeem that Kepler had haſtily drawn the above erroneous principle from this one numerical example, or little more, falſe as it is: for had he made the trial in many inſtances, although erroneouſly computed, they could not eaſily have been ſo uniformly ſo, as to afford the ſame falſe concluſion. And therefore from hence, and what he ſays at the concluſion of that appendix, it may be infered that he either never attempted the demonſtration of the property in queſtion, or elſe that he found himſelf embarraſed with it, and unable to accompliſh it, and therefore diſpatched it in the ambiguous manner in which it appears.

But it may eaſily be ſhewn, not only that the third differences of the logarithms at different places, are as the cubes of the firſt differences; but, in general, that the numbers in any one and the ſame order of differences, at different places, are as that power of the numbers in the firſt differences, whoſe index is the ſame as that of the order; or that the ſecond, third, fourth, &c, differences, will be as the ſecond, third, fourth, &c, powers of the firſt differences. For the ſeveral orders of differences, when the abſolute numbers differ by indefinitely ſmall parts, are as the ſeveral orders of fluxions of the logarithms; but if x be any number, then $\frac{m\dot{x}}{x}$ is the fluxion of the logarithm of x, to the modulus m, and the ſecond fluxion, or the fluxion of this fluxion, is $-\frac{m\dot{x}^2}{x^2}$, ſince $\dot{x}$ is conſtant; and the third, fourth, &c, fluxions, are $\frac{2m\dot{x}^3}{x^3}$, $-\frac{2.3m\dot{x}^4}{x^4}$, &c; that is, the firſt, ſecond, third, fourth, fifth, ſixth, &c, orders of fluxions, are equal to the modulus m multiplied into each of theſe terms, $\frac{\dot{x}}{x}$, $-\frac{1\dot{x}^2}{x^2}$, $\frac{1.2\dot{x}^3}{x^3}$, $-\frac{1.2.3\dot{x}^4}{x^4}$, $\frac{1.2.3.4\dot{x}^5}{x^5}$, $-\frac{1.2.3.4.5\dot{x}^6}{x^6}$, &c, where it is evident that the fluxion of any order, is as that power of the firſt fluxion, whoſe index is the ſame as the number of the order. And theſe quantities would actually be the ſeveral terms of the differences themſelves, if the differences of the numbers were indefinitely ſmall. But they vary the more from them, as the differences of the abſolute numbers differ from ', or as the ſaid conſtant numerical difference 1, approaches towards the value of x the number itſelf. However, upon the whole, the ſeveral orders vary proportionably, ſo as ſtill ſenſibly to preſerve

the ſame analogy, namely that two *n*th differences are in proportion as the *n*th powers of their reſpective firſt differences.

Of Briggs's Conſtruction of his Logarithms.

Nearly according to the methods deſcribed in page 47, Mr. Briggs conſtructed the logarithms of the prime numbers, as appears from his relation of this buſineſs in the *Arithmetica Logarithmica*, printed in 1624, where he details, in an ample manner, the whole conſtruction and uſe of his logarithms. The work is divided into thirty-two chapters or ſections. In the firſt of theſe, logarithms in a general ſenſe are defined, and ſome properties of them illuſtrated. In the ſecond chapter he remarks, that it is moſt convenient to make 0 the logarithm of 1; and on that ſuppoſition he exemplifies theſe following properties, namely, that the logarithms of all numbers are either the indices of powers, or proportional to them; that the ſum of the logarithms of two or more factors, is the logarithm of their product; and that the difference of the logarithm of two numbers, is the logarithm of their quotient. In the third ſection he ſtates the other aſſumption which is neceſſary to limit his ſyſtem of logarithms, namely, making 1 the logarithms of 10, as that which produces the moſt convenient form of logarithms; He hence alſo takes occaſion to ſhew that the powers of 10, namely 100,1000, &c, are the only numbers which can have rational logarithms. The fourth ſection treats of the characteriſtic; by which name he diſtinguiſhes the integral, or firſt part, of a logarithm towards the left-hand, which expreſſes one leſs than the number of integer places or figures in the number belonging to that logarithm, or how far the firſt figure of this number is removed from the place of units; namely, that 0 is the characteriſtic of the logarithms of all numbers from 1 to 10; and 1 the characteriſtic of all thoſe from 10 to 100; and 2 that of thoſe from 100 to 1000; and ſo on.

He begins the fifth chapter with remarking, that his logarithms may chiefly be conſtructed by the two methods which were mentioned by Napier, as above related, and for the ſake of which he here premiſes ſeveral *lemmata*, concerning the powers of numbers and their indices, and how many places or figures are in the products of numbers, obſerving that the product of two numbers will conſiſt of as many figures as there are in both factors, unleſs perhaps the product of the firſt figures in each factor be expreſſed by one figure only, which often happens, and then commonly there will be one figure in the product leſs than in the two factors; as alſo that, of any two of the terms, in a ſeries of geometricals, the reſults will be equal by raiſing each term to the power denoted by the index of the other; or any number raiſed to the power denoted by the logarithm of the other, will be equal to this latter number raiſed to the power denoted by the logarithm of the former; and conſequently if the one number be 10, whoſe logarithm is 1 with any number of ciphers, then any number raiſed to the power whoſe index is 1000 &c, or the logarithm of 10, will be equal to 10 raiſed to the power whoſe index is the logarithm

garithm of that number; that is, the logarithm of any number in this ſcale, where 1 is the logarithm of 10, is the index of that power of 10 which is equal to the given number. But the index of any integral power of 10, is one leſs than the number of places in that power, conſequently the logarithm of any other number, which is no integral power of 10, is not quite one leſs than the number of places in that power of the given number whoſe index is 1000 &c, or the logarithm of 10.

Find therefore the 10th, or 100th, or 1000th, &c, power of any number, as ſuppoſe 2, with the number of figures in ſuch power; then ſhall that number of figures always exceed the logarithm of 2, altho' the exceſs will be conſtantly leſs than 1.

An example of this proceſs is here given in the margin; where the 1ſt column contains the ſeveral powers of 2, the 2d their correſponding indices, and the 3d contains the number of places in the powers in the firſt column; and of theſe numbers in the third column, ſuch as are on the lines of thoſe indices that conſiſt of 1 with ciphers, are continual approximations to the logarithm of 2, being always too great by leſs than 1 in the laſt figure, that logarithm being 30102999566398 &c.

And here ſince the exact powers of 2 are not required, but only the number of figures they conſiſt of, as ſhewn by the third column, only a few of the firſt figures of the powers in the firſt column are retained, thoſe being ſufficient to determine the number of places in them; and the multiplications in raiſing theſe powers are performed in a contracted way, ſo as to have the fifth or laſt figure in them true to the nearеſt unit. Indeed theſe multiplications might be performed in the ſame manner, retaining only the firſt three figures, and thoſe to the nearеſt unit in the third place; which would make this a very eaſy way indeed of finding the logarithms of a few prime numbers.

Powers of 2	Indices.	No. of places, or logs.
2	1	1
4	2	1
16	4	2

18433	400000000	120411999
33977	800000000	240823997
46129	1000000000	301029996

It may alſo be remarked, that thoſe ſeveral powers, whoſe indices are 1 with ciphers, are raiſed by thrice ſquaring from the former powers, and multiplying the firſt by the third of theſe ſquares; making alſo the correſponding doublings and additions of their indices: thus, the ſquare of 2 is 4, the ſquare of 4 is 16, the ſquare of 16 is 256, and 256 multiplied by 4 is 1024; in like manner, the double of 1 is 2, the double of 2 is 4, the double of 4 is 8, and 8 added to 2 makes 10. And the ſame for all the following powers and indices. The numbers in the third column, which ſhew how many places are in the correſponding powers in the firſt column, are produced in the very ſame way as thoſe in the ſecond column, namely, by three duplications and one addition; only obſerving to ſubtract 1 when the product of the firſt figures are expreſſed by one figure, or when the firſt figures exceed thoſe of the number or power next above them. It may farther be obſerved that, like as the firſt number in each quaternion, or ſpace of four lines or numbers, in the third column, approximates to the logarithm of 2, the firſt number in the firſt quaternion of the firſt column; ſo the ſecond, third, and fourth terms of each quaternion in the third column, approximate to the logarithm of 4, 16, and 256, the ſecond, third, and fourth numbers in the firſt quaternion of the firſt column. And moreover, by cutting off one, two, three, &c, figures, as the index or integral part, from the ſaid logarithms of 2, 4, 16, and 256, the firſt, ſecond, third and fourth numbers in the firſt quaternion of the firſt column, the remaining figures will be the decimal part of the logarithms of the correſponding firſt, ſecond, third, and fourth numbers in the following ſecond, third, fourth, &c, quaternions: the reaſon of which is, that any number of any quaternion in the firſt column, is the tenth power of the correſponding term in the next preceding quaternion. So that the third column contains the logarithms of all the numbers in the firſt column: A property which, if Dr. Newton had been aware of, he could not well have committed ſuch groſs miſtakes as are found in a table of his ſimilar to that above given, in which moſt of the numbers in the latter quaternions are totally erroneous; and his confuſed and imperfect account of this method, would induce one to believe that he did not well underſtand it.

In the ſixth chapter our illuſtrious author begins to treat of the other general method of finding the logarithms of prime numbers, which he thinks is an eaſier way than the former, at leaſt when the logarithm is required to a great many places of figures. This method conſiſts in taking a great number of continued geometrical means between 1 and the given number whoſe logarithm is required; that is, firſt extracting the ſquare root of the given number, then the root of the firſt root, the root of the ſecond root, the root of the third root, and ſo on till the laſt root ſhall exceed 1 by a very ſmall decimal, greater or leſs according to the intended number of places to be in the logarithm ſought: Then finding the logarithm of this ſmall number, by methods deſcribed below, he doubles it as often as he made extractions of the ſquare root, or, which is the ſame thing, he multiplies

multiplies it by ſuch power of 2 as is denoted by the ſaid number of extractions, and the reſult is the required logarithm of the given number; as is evident from the nature of logarithms. The rule to know how far to continue this extraction of roots is, that the number of decimal places in the laſt root be double the number of true places required to be found in the logarithm, and that the firſt half of them be ciphers; the integer being 1: The reaſon of which is, that then the ſignificant figures in the decimal, after the ciphers, are directly proportional to thoſe in the correſponding logarithms; ſuch figures in the natural number being the half of thoſe in the next preceding number, like as the logarithm of the laſt number is the half of the preceding logarithm. Therefore, any one ſuch ſmall number, with its logarithm, being once found, by the continual extractions of ſquare roots out of a given number, as 10, and correſponding biſections of its given logarithm 1; the logarithm for any other ſuch ſmall number, derived by like continual extractions from another given number, whoſe logarithm is ſought, will be found by one ſingle proportion: which logarithm is then to be doubled according to the number of extractions, or multiplied at once by the like power of 2, for the logarithm of the number propoſed. To find the firſt ſmall number and its logarithm, our author begins with the number 10 and its logarithm 1, and extracts continually the root of the laſt number, and biſects its logarithm, as here regiſtered in the margin, but to far more places of figures, till he arrives at the 53d and 54th roots, with their annexed logarithms, as here below;

	10, given no.	1, its log.
1	3·162277 &c	0·5
2	1·778279	0·25
3	1·333521	0·125
4	1·154781	0·0625
5	1·074607	0·03125
	&c.	&c.

	Numbers.	Logarithms.
53	1·00000,00000,00000,25563,82986,40064,70	0·00000,00000,00000,11102,23024,62515,65404
54	1·00000,00000,00000,12781,91493,20032,35	0·00000,00000,00000,05551,11512,31257,82702

where the decimals in the natural numbers are to each other in the ratio of the logarithms, namely in the ratio of 2 to 1: and therefore any other ſuch ſmall number being found, by continual extraction or otherwiſe. it will then be as 12781 &c, is to 5551 &c, ſo is that other ſmall decimal, to the correſponding ſignificant figures of its logarithm. But as every repetition of this proportion requires both a very long multiplication and diviſion, he reduces this conſtant ratio to another equivalent ratio whoſe antecedent is 1, by which all the diviſions are ſaved: thus,

as 12781 &c ; 5551 &c : : 1000 &c : 4342944819032518o4,

that is, the logarithm of 1·00000,00000,00000,1

is 0·00000,00000,00000,04342,94481,90325,1804;

and therefore this laſt number being multiplied by any ſuch ſmall decimal, found as above by continual extraction, the product will be the correſponding logarithm of ſuch laſt root.

But as the extraction of ſo many roots is a very troubleſome operation, our author deviſes ſome ingenious contrivances to abridge that labour

labour. And firſt, in the 7th chapter, by the following device, to have fewer and eaſier extractions to perform: namely, raiſing the powers from any given prime number, whoſe logarithm is ſought, till a power of it be found ſuch that its firſt figure on the left hand is 1, and the next to it either one or more ciphers; then, having divided this power by 1 with as many ciphers as it has figures after the firſt, or ſuppoſing all after the firſt to be decimals, the continual roots from this power are extracted till the decimal become ſufficiently ſmall, as when the firſt fifteen places are ciphers; and then by multiplying the decimal by 43429 &c, we have the logarithm of this laſt root; which logarithm multiplied by the like power of the number 2, gives the logarithm of the firſt number from which the extraction was begun: to this logarithm prefixing a 1, or 2, or 3, &c, according as this number was found by dividing the power of the given prime number by 10, or 100, or 1000, &c; and laſtly, dividing the reſult by the index of that power, the quotient will be the required logarithm of the given prime number. Thus, to find the logarithm of 2: it is firſt raiſed to the 10th power, as in the margin, before the firſt figures come to be 10; then, dividing by 1000, or cutting off for decimals all the figures after the firſt or 1, the root is continually extracted from the quotient 1,024, till the 47th extraction, which gives 1,00000,00000,00000,16851,60570,53949,77; the decimal part of which multiplied by 43429 &c, gives 0,00000,00000,00000,07318,55936,90623,9368 for its logarithm: and this being continually doubled for 47 times, will give the logarithms of all the roots up to the firſt number: or being at once multiplied by the 47th power of 2, viz. 140737488355328, which is raiſed as in the margin, it gives 0,01029,99566,39811,95265,27744 for the logarithm of the number 1,024, true to 17 or 18 decimals: to this prefix 3, ſo ſhall 3,0102 &c be the logarithm of 1024: and laſtly, becauſe 2 is the tenth root of 1024, divide by 10, ſo ſhall 0,30102,99956,63981,1952 be the logarithm required to the given number 2.

The logarithms of 1, 2, and 10 being now known; it is remarked that the logarithm of 5 becomes known; for ſince $10 \div 2$ is $= 5$, therefore log. 10 — log. 2 = log. 5, which is 0,69897,00043,36018,8058; and that from the multiplications and diviſions of theſe three 2,5,10, with the correſponding additions and ſubtractions of their logarithms, a multitude of other numbers and their logarithms are produced; ſo from the powers of 2 are obtained 4, 8, 16, 32, 64, &c; from the powers of 5 theſe 25, 125, 625, 3125, &c; alſo the powers of 5 by thoſe of 10 give 250, 1250, 6250, &c; and the powers of 2 by thoſe of 10 give 20, 200, 2000, &c; 40, 400, 80, 800, &c; likewiſe by diviſion are obtained $2\frac{1}{2}$, $1\frac{1}{4}$, $12\frac{1}{2}$, $6\frac{1}{4}$, $1\frac{3}{25}$, $3\frac{1}{25}$, $6\frac{3}{25}$, &c,

He

He then obſerves that the logarithm of 3, the next prime number, will be beſt derived from that of 6, in this manner: 6 raiſed to the 9th power becomes 10077696, which divided by 10000000, gives 1,0077696, and the root from this continually extracted till the 46th, is 1,00000,00000,00000,10998,59345,88155,71866; the decimal part of which multiplied by 43429 &c, gives 0,00000,00000,00000,04776,62844,78608,0304 for its logarithm; and this 46 times doubled, or multiplied by the 46th power of 2, gives 0,00336,12534,52792,69 for the logarithm of 1,0077696; to which adding 7, the logarithm of the diviſor 10000000, and dividing by 9, the index of the power of 6, there reſults 0,77815,12503,83643,63 for the logarithm of 6; from which ſubtracting the logarithm of 2, there remains 0,47712,12547,19662,44 for the logarithm of 3.

In the eighth chapter our ingenious author deſcribes an original and eaſy method of conſtructing, by means of differences, the continual mean proportionals which were before found by the extraction of roots. And this, with the other methods of generating logarithms by differences, in this book as well as in our author's *Trigonometria Britannica*, are I believe the firſt inſtances that are to be found of making ſuch uſe of differences, and ſhew him to have been the inventor of what may be called the *Differential Method*. He ſeems to have diſcovered this method in the following manner: Having obſerved that theſe continual means between 1 and any number propoſed, found by the continual extraction of roots, approach always nearer and nearer to the halves of each preceding root, as is viſible when they are placed together under each other; and indeed it is found that as many of the ſignificant figures of each decimal part, as there are ciphers between them and the integer 1, agree with the half of thoſe above them; I ſay, having obſerved this evident approximation, he ſubtracted each of theſe decimal parts, which he called A or the firſt differences, from half the next preceding one, and by comparing together the remainders or ſecond differences, called B, he found that the ſucceeding were always nearly equal to $\frac{1}{4}$ of the next preceding ones; then taking the difference between each ſecond difference and $\frac{1}{4}$ of the preceding one, he found that theſe third differences, called C, were nearly in the continual ratio of 8 to 1; again taking the difference between each C and $\frac{1}{8}$ of the next preceding, he found that theſe fourth differences, called D, were nearly in the continual ratio of 16 to 1; and ſo on, the 5th (E), 6th (F), &c, differences, being nearly in the continual ratio of 32 to 1, of 64 to 1, &c:

these plain observations being made, they very naturally and clearly suggested to him the notion and method of constructing all the remaining numbers from the differences of a few of the first, found by extracting the roots in the usual way. This will evidently appear from the annexed specimen of a few of the first numbers in the last example for finding the logarithm of 6; where after the 9th number the rest are supposed to be constructed from the preceding differences of each, as here shewn in the 10th and 11th. And it is evident that, in proceeding, the trouble will become always less and less, the differences gradually vanishing, till at last only the first differences remain. And that generally each less difference is shorter than the next greater, by as many places as there are ciphers at the beginning of the decimal in the number to be generated from the differences.

He then concludes this chapter with an ingenious, but not obvious, method of finding the differences B, C, D, E, &c, belonging to any number, as suppose the 9th, from that number itself, independent of any of the preceding 8th, 7th, 6th, 5th, &c; and it is this: Raise the decimal A to the 2d, 3d, 4th, 5th, &c powers; then will the 2d (B), 3d (C), 4th (D), &c differences, be as here below, viz.

B=

$B = \frac{1}{2}A^2$,

$C = \frac{1}{2}A^3 + \frac{1}{6}A^4$,

$D = \frac{7}{8}A^4 + \frac{7}{8}A^5 + \frac{7}{16}A^6 + \frac{1}{8}A^7 + \frac{1}{64}A^8$,

$E = 2\frac{5}{8}A^5 + 7A^6 + 10\frac{11}{16}A^7 + 12\frac{69}{128}A^8 + 11\frac{11}{64}A^9 + 7\frac{105}{128}A^{10}$,

$F = 13\frac{9}{16}A^6 + 81\frac{1}{8}A^7 + 296\frac{57}{128}A^8 + 834\frac{43}{128}A^9 + 1953\frac{285}{512}A^{10}$ &c.

$G = 122\frac{1}{16}A^7 + 1510\frac{67}{128}A^8 + 11475\frac{71}{128}A^9 + 68372\frac{29}{64}A^{10}$ &c.

$H = 1937\frac{91}{128}A^8 + 47151\frac{91}{128}A^9 + 706845\frac{149}{256}A^{10}$ &c.

$I = 54902\frac{89}{128}A^9 + 2558465\frac{235}{256}A^{10}$ &c.

$K = 2805527A^{10}$ &c.

&c.

Thus in the 9th number of the foregoing example, omitting the ciphers at the beginning of the decimals, we have

$A = 1,51164,65999,05672,95048,8$
$A^2 = 2,28507\ 54430,06381,6726$
$A^3 = 3,45422,65239,48546,2$
$A^4 = 5,22156,97802,288$
$A^5 = 7,89316,8205$
$A^6 = 11,93168,1$
&c.

Consequently

$\frac{1}{2}A^2 = 1,14253,77215,03190,8363 = B$

$\frac{1}{2}A^3 = 1,72711,32619,74273$
$\frac{1}{6}A^4 = 65269.62225$
$\frac{1}{2}A^3 + \frac{1}{6}A^4 = 1,72711,97889,36498 = C$

$\frac{7}{8}A^4 = 4,56887,35577$
$\frac{7}{8}A^5 = 6,90652$
$\frac{7}{16}A^6 = 5$
$\frac{7}{8}A^4 + \frac{7}{8}A^5 + \frac{7}{16}A^6 = 4,56894,26234 = D$

$2\frac{5}{8}A^5 = 20,71957$
$7A^6 = 83$
$2\frac{5}{8}A^5 + 7A^6 = 20,72040 = E$

which agree with the like differences in the foregoing ſpecimen.

In the ninth chapter, after obſerving that from the logarithms of 1, 2, 3, 5, and 10, before found, are to be determined, by addition and ſubtraction, the logarithms of all other numbers which can be produced from theſe by multiplication and diviſion; for finding the logarithms of other prime numbers, inſtead of that in the ſeventh chapter, our author then ſhews another ingenious method of obtaining numbers beginning with 1 and ciphers, and ſuch as to bear a certain relation to ſome prime number by means of which its logarithm may be found. The method is this: Find three products having the common difference 1, and ſuch that two of them are produced from factors having given logarithms, and the third produced from the prime number, whoſe logarithm is required, either multiplied by itſelf, or by ſome other number whoſe logarithm is given: then

then the greateſt and leaſt of theſe three products being multiplied together, and the mean by itſelf, there ariſe two other products alſo differing by 1, of which the greater divided by the leſs, gives for a quotient 1 with a ſmall decimal, having ſeveral ciphers at the beginning. Then the logarithm of this quotient being found as before, from thence will be deduced the required logarithm of the given prime number. Thus, if it be propoſed to find the logarithm of the prime number 7; here $6 \times 8 = 48$, $7 \times 7 = 49$, and $5 \times 10 = 50$ will be the three products, of which the logarithms of 48 and 50, the 1ſt and 3d, will be given from thoſe of their factors 6, 8, 5, 10; alſo $48 \times 50 = 2400$, and $49 \times 49 = 2401$ are the two new products, and $2401 \div 2400 = 1{\cdot}00041\frac{2}{3}$ their quotient: then the leaſt of 44 means between 1 and this quotient is 1,00000,00000,00000,02367, 98249,04333,6405, which multiplied by 43429 &c, produces 0,00000,00000,00000,01028,40172,88387,29715 for its logarithm; which being 44 times doubled, or multiplied by 17592186044416, produces 0,00018,09183,45421,30 for the logarithm of the quotient $1,00041\frac{2}{3}$; which being added to the logarithm of the diviſor 2400, gives the logarithm of the dividend 2401; then the half of this logarithm is the logarithm of 49 the root of 2401, and the half of this again gives 0,84509,80400,14256,82 for the logarithm of 7 which is the root of 49.——The author adds another example to illuſtrate this method, and then ſets down the requiſite factors, products, and quotients for finding the logarithms of all other prime numbers up to 100.

The 10th chapter is employed in teaching how to find the logarithms of fractions, namely by ſubtracting the logarithm of the denominator from that of the numerator, then the logarithm of the fraction is the remainder; which therefore is either abundant or defective, that is poſitive or negative, as the fraction is greater or leſs than 1.

In the 11th chapter we are ſhewn an ingenious contrivance for very accurately finding intermediate numbers to given logarithms, by the proportional parts. On this occaſion it is remarked, that while the abſolute numbers increaſe uniformly, the logarithms increaſe unequally, with a decreaſing increment; for which reaſon it happens, that either logarithms or numbers corrected by means of the proportional parts, will not be quite accurate, the logarithms ſo found being always too ſmall, and the abſolute numbers ſo found too great; but yet ſo however as that they approach much nearer to accuracy towards the end of the table, where the increments or differences become much nearer to equality, than in the former parts of the table. And from this property our author, ever fruitful in happy expedients to obviate natural difficulties, contrives a device to throw the proportional part, to be found from the numbers and logarithms, always near the end of the table, in whatever part they may happen naturally to fall. And it is this: Rejecting the characteriſtic of any given logarithm, whoſe number is propoſed to be found, take the arithmetical complement of the decimal part, by ſubtracting it from 1,000 &c, the logarithm of of 10; then find in the table the logarithm next leſs than this arithmetical

metical complement, together with its abſolute number; to this tabular logarithm add the logarithm that was given, and the ſum will be a logarithm neceſſarily falling among thoſe near the end of the table; find then its abſolute number, corrected by means of the proportional part, which will not be very inaccurate, as falling near the end of the table; this being divided by the abſolute number, before found for the logarithm next leſs than the arithmetical complement, the quotient will be the required number anſwering to the given logarithm; which will be much more correct than if it had been found from the proportional part of the difference where it naturally happened to fall: and the reaſon of this operation is evident from the nature of logarithms. But as this diviſor, when taken as the number anſwering to the logarithm next leſs than the arithmetical complement, may happen to be a large prime number; it is farther remarked, that inſtead of this number and its logarithm, we may uſe the next leſs compoſite number which has ſmall factors, and *its* logarithm; becauſe the diviſion by thoſe ſmall factors, inſtead of by the number itſelf, will be performed by the ſhort and eaſy way of diviſion in one line. And for the more eaſy finding proper compoſite numbers and their factors, our author here ſubjoins an abacus or liſt of all ſuch numbers, with their logarithms and component factors, from 1000 to 10000; from which the proper logarithms and factors are immediately obtained by inſpection. Thus, for example, to find the root of 10800, or the mean proportional between 1 and 10800: The logarithm of 10800 is 4,03342,37554,8695, the half of which is 2,01671,18777,4347 the logarithm of the number ſought, the arithmetical complement of which logarithm is 0,98328,81222,5653; now the neareſt logarithm to this in the abacus is 0,98227,12330,3957, and its annexed number is 9600, the factors of which are 2, 6, 8; to this laſt logarithm adding the logarithm of the number ſought, the ſum is 0,99898,31107,8304, whoſe abſolute number, corrected by the proportional part, is 99766,12651,6521, which being divided continually by 2, 6, 8, the factors of 96, the laſt quotient is 103,92304845471; which is pretty correct, the true number being $103,92304845413 = \sqrt{10800}$.

We now arrive at the 12th and 13th chapters, in which our ingenious author firſt of all teaches the rules of the *Differential Method*, in conſtructing logarithms by interpolation from differences. This is the ſame method which has ſince been more largely treated of by later authors, and particularly by the learned Mr. Cotes in his *Canonotechnia*. How Mr. Briggs came by it, does not well appear, as he only delivers the rules, without laying down the principles or inveſtigation of them. He divides the method into two caſes, namely when the ſecond differences are equal or nearly equal, and when the differences run out to any length whatever. The former of theſe is treated in the 12th chapter; and he particularly adapts it to the interpolating 9 equidiſtant means between two given terms, evidently for this reaſon, that then the powers of 10 become the principal multipliers or diviſors, and ſo the operations performed mentally. The ſubſtance of his proceſs is this: Having given two abſolute numbers with

with their logarithms, to find the logarithms of 9 arithmetical means between the given numbers: Between the given logarithms take the 1ſt difference, as well as between each of them and their next or equidiſtant greater and leſs logarithms; and likewiſe the 2d differences, or the two differences of theſe three 1ſt differences; then if theſe 2d differences be equal, multiply one of them ſeverally by the numbers 45, 35, &c, in the annexed tablet, dividing each product by 1000, that is cutting off three figures from each; laſtly to $\frac{1}{10}$ of the 1ſt difference of the given logarithms add ſeverally the firſt five quotients, and ſubtract the other five, ſo ſhall the ten reſults be the reſpective 1ſt differences to be continually added, to compoſe the required ſeries of logarithms. Now this amounts to the ſame thing as what is at this day taught in the like caſe: we know that if A be any term of an equidiſtant ſeries of terms, and a, b, c, &c, the firſt of the 1ſt, 2d, 3d, &c, order of differences; then the term z, whoſe diſtance from A is expreſſed by x, will be thus, $z = A + xa + x.\frac{x-1}{2}b + x.\frac{x-1}{2}.\frac{x-2}{3}c +$ &c. And if now, with our author, we make the 2d differences equal, then c, d, e, &c, will all vaniſh or be equal to 0, and z will become barely $= A + xa + x.\frac{x-1}{2}b$.

Series of terms.	The Differences.
A	
$A+\frac{1}{10}a+\frac{0}{100}b$	$\frac{1}{10}a+\frac{9}{100}b=\frac{1}{10}a+\frac{45}{1000}b$
$A+\frac{2}{10}a+\frac{10}{100}b$	$\frac{1}{10}a+\frac{7}{100}b=\frac{1}{10}a+\frac{35}{1000}b$
$A+\frac{3}{10}a+\frac{21}{100}b$	$\frac{1}{10}a+\frac{5}{100}b=\frac{1}{10}a+\frac{25}{1000}b$
$A+\frac{4}{10}a+\frac{24}{100}b$	$\frac{1}{10}a+\frac{3}{100}b=\frac{1}{10}a+\frac{15}{1000}b$
$A+\frac{1}{10}a+\frac{25}{100}b$	$\frac{1}{10}a+\frac{1}{100}b=\frac{1}{10}a+\frac{5}{1000}b$
$A+\frac{6}{10}a+\frac{24}{100}b$	$\frac{1}{10}a-\frac{1}{100}b=\frac{1}{10}a-\frac{5}{1000}b$
$A+\frac{7}{10}a+\frac{21}{100}b$	$\frac{1}{10}a-\frac{3}{100}b=\frac{1}{10}a-\frac{15}{1000}b$
$A+\frac{8}{10}a+\frac{16}{100}b$	$\frac{1}{10}a-\frac{5}{100}b=\frac{1}{10}a-\frac{25}{1000}b$
$A+\frac{9}{10}a+\frac{9}{100}b$	$\frac{1}{10}a-\frac{7}{100}b=\frac{1}{10}a-\frac{35}{1000}b$
$A+a$	$\frac{1}{10}a-\frac{9}{100}b=\frac{1}{10}a-\frac{45}{1000}b$

Therefore if we take x ſucceſſively equal to $\frac{0}{10}, \frac{1}{10}, \frac{2}{10}, \frac{3}{10}$, &c, we ſhall have the annexed ſeries of terms with their differences. Where it is to be obſerved, that our author had reduced the differences from the 1ſt to the 2d form, as he thought it eaſier to multiply by 5 than to divide by 2. Alſo all the laſt terms $(x.\frac{x-1}{2}b)$ are ſet down poſitive, becauſe in the logarithms b is negative.——If the two 2d differences be only nearly equal, take an arithmetical mean between them, and proceed with it the ſame as above with one of the equal 2d differences.—He alſo ſhews how to find any one ſingle term, independent of the reſt; and concludes the chapter with pointing out a method of finding the proportional part more accurately than before.

In the 13th chapter our author remarks, that the beſt way of filling up the intermediate chiliads of his table, namely from 20000 to 90000, is by quinquiſection, or interpoſing four equidiſtant means between two given terms; the method of performing which he thus particularly deſcribes. Of the given terms, or logarithms, and two or three others on each ſide of them, take the 1ſt, 2d, 3d, &c differences, till

till the laſt differences come out equal, which ſuppoſe to be the 5th differences: divide the 1ſt differences by 5, the 2d by 25, the 3d by 125, the 4th by 625, and the 5th by 3125, and call the reſpective quotients the 1ſt, 2d, 3d, 4th, 5th *mean* differences; or, inſtead of dividing by theſe powers of 5, multiply by their reciprocals $\frac{2}{10}$, $\frac{4}{100}$, $\frac{8}{1000}$, $\frac{16}{10000}$, $\frac{32}{100000}$, that is multiplied by 2, 4, 8, 16, 32, cutting off reſpectively one, two, three, four, five figures from the end of the products, for the ſeveral mean differences: then the 4th and 5th of theſe mean differences are ſufficiently accurate, but the 1ſt, 2d, and 3d are to be corrected in this manner; from the mean third differences ſubtract three times the 5th difference, and the remainders are the *correct* 3d differences; from the mean 2d differences ſubtract double the 4th differences, and the remainders are the correct 2d differences; laſtly from the mean 1ſt differences take the correct 3d differences, and $\frac{1}{5}$ of the 5th difference, and the remainders will be the correct firſt differences. Such are the corrections when the differences extend as far as the 5th. However in compleating thoſe chiliads in this way, there will be only 3 orders of differences, as neither the 4th nor 5th will enter the calculation, but will vaniſh through their ſmallneſs: therefore the mean 2d and 3d difference will need no correction, and the mean firſt differences will be corrected by barely ſubtracting the 3d from them. Theſe preparatory numbers being thus found, all the 2d differences of the logarithms required, will be generated by adding continually, from the leſs to the greater, the conſtant 3d difference; and the ſeries of 1ſt differences will be found by adding the ſeveral 2d differences; and laſtly by adding continually theſe 1ſt differences to the 1ſt given logarithm &c, the required logarithmic terms will be generated.

Theſe eaſy rules being laid down, Mr. Briggs next teaches how by them the remaining chiliads may beſt be compleated: namely, having here the logarithm for all numbers up to 20000, find the logarithm to every 5 beyond this, or of 20005, 20010, 20015, &c, in this manner; to the logarithms of the 5th part of each of thoſe, namely 4001, 4002, 4003, &c, add the conſtant logarithm of 5, and the ſums will be the logarithms of all the terms of the ſeries 20005, 20010, 20015, &c: and theſe logarithms will have the very ſame differences as thoſe of the ſeries 4001, 4002, 4003, &c; by means of which therefore interpoſe 4 equidiſtant terms by the rules above; and thus the whole canon will be eaſily compleated.

He here alſo extends the rules for correcting the mean differences in quinquiſection, as far as the 20th difference; he alſo lays down ſimilar rules for triſection, and ſpeaks of general rules for any other ſection, but omitted as being leſs eaſy. So that he appears to have been poſſeſſed of all that Cotes afterwards delivered in his *Canonotechnia ſive Conſtructio Tabularum per Differentias*, drawn from the *Differential Method*, as their general rules exactly agree, Briggs's mean and correct differences being by Cotes called round and quadrat differences, becauſe he expreſſes them by the numbers 1, 2, 3, &c, written reſpectively in a ſmall circle and ſquare.

Mr.

Mr. Briggs alſo obſerves that the ſame rules equally apply to the conſtruction of equidiſtant terms of any other kind, ſuch as ſines, tangents, ſecants, the powers of numbers, &c: and farther remarks, that of the ſines of three equidifferent arcs, all the remote differences may be found by the rule of proportion, becauſe the ſines and their 2d, 4th, 6th, 8th, &c differences are continued proportionals, as are alſo the 1ſt, 3d, 5th, 7th, &c differences among themſelves; and like as the 2d, 4th, 6th, &c differences are proportional to the ſines of the mean arcs, ſo alſo are the 1ſt, 3d, 5th, &c differences proportional to the coſines of the ſame arcs. Moreover with regard to the powers of numbers, he remarks the following curious properties; 1ſt, that they will each have as many orders of differences as are denoted by the index of the power, the ſquares having two orders of differences, the cubes three, the 4th powers four, &c: ſecond, that the laſt differences will be all equal, and each equal to the common difference of the ſides or roots raiſed to the given power and multiplied by $1 \times 2 \times 3 \times 4$ &c, continued to as many terms as there are units in the index; ſo if the roots differ by 1, the 2d difference of the ſquares will be each 1×2 or 2, the 3d differences of the cubes each $1 \times 2 \times 3$ or 6, the 4th differences of the 4th powers each $1 \times 2 \times 3 \times 4$ or 24, and ſo on; and if the common difference of the roots be any other number n, then the laſt differences of the ſquares, cubes, 4th powers, 5th powers, &c, will be reſpectively $2n^2$, $6n^3$, $24n^4$, $120n^5$, &c.

Beſides what was ſhewn in the eleventh chapter concerning the taking out the logarithms of large numbers by means of proportional parts, he employs the next or 14th chapter in teaching how, from the firſt ten chiliads only, and a ſmall table of one page, here given, to find the number anſwering to any logarithm, and the logarithm to any number conſiſting of fourteen places of figures. *

Having thus fully ſhewn the conſtruction and chief properties of his logarithms, our ingenious author, in the remaining eighteen chapters, exemplifies their uſes in various curious and important ſubjects; ſuch as The Rule-of-three, or rule of proportion; finding

* It is no more than a large exemplification of this method of Briggs's that has been printed ſo late as 1771, in a 4to. tract by Mr. Rob. Flower, under the title of *The Radix, a New Way of making Logarithms*. Although Briggs's work might not be known to this writer.—Since this was written I have been favoured with the following anecdote, concerning Mr. Flower and his work, by the Rev. Dr. Horſley, the learned editor of the works of Sir I. Newton. "This Robert Flower was a very obſcure, and probably an illiterate man. He was maſter of a writing ſchool in the town of Biſhop Stortford in Hertfordſhire. He communicated his Radix, before he publiſhed it, to my late learned friend Math. Raper, Eſq. of Thorley Hall. I was at Thorley at the time, upon a viſit to my father, who was rector of the pariſh; and I well remember that Mr. Raper told me with great ſurprize, that Flower (who was known to us both by name as the writing-maſter of the neighbouring market town) had fallen upon Briggs's way of finding all logarithms from the firſt ten chiliads. And he was ſo well perſuaded that Flower had made the diſcovery for himſelf, without any light from Briggs, that with his accuſtomed munificence he rewarded the man's ingenuity with a preſent of ten guineas; informing him I believe that his work had been done before, and diſſuading the publication."

the

the roots of given numbers; finding any number of mean proportionals between two given terms; with other arithmetical rules: Alſo various geometrical ſubjects, as 1ſt, Having given the ſides of any plane triangle, to find the area, perpendicular, angles, and diameters of the inſcribed and circumſcribed circles; 2d, In a right-angled triangle, having given any two of theſe, to find the reſt, viz. one leg and the hypotenuſe, one leg and the ſum or difference of the hypotenuſe and the other leg, the two legs, one leg and the area, the area and the ſum or difference of the legs, the hypotenuſe and ſum or difference of the legs, the hypotenuſe and area, and the perimeter and area; 3d, Upon a given baſe to deſcribe a triangle equal and iſoperimetrical to another triangle given; 4th, To deſcribe the circumference of a circle ſo, that the three diſtances from any point in it to the three angles of a given plane triangle, ſhall be to one another in a given ratio; 5th, Having given the baſe, the area, and the ratio of the two ſides of a plane triangle, to find the ſides; 6th, Given the baſe, difference of the ſides, and area of a triangle, to find the ſides; 7th, To find a triangle whoſe area and perimeter ſhall be expreſſed by the ſame number; 8th, Of four given lines, of which the ſum of any three is greater than the fourth, to form a quadrilateral figure about which a circle may be deſcribed; 9th, Of the diameter, circumference, and area of a circle, and the ſurface and ſolidity of the ſphere generated by it, having any one given, to find any of the reſt; 10th, Concerning the ellipſe, ſpheroid, and gauging; 11th, To cut a line or a number in extreme and mean ratio; 12th, Given the diameter of a circle, to find the ſides and areas of the inſcribed and circumſcribed regular figures of 3, 4, 5, 6, 8, 10, 12, and ſixteen ſides; 13th, Concerning the regular figures of 7, 9, 15, 24, and 30 ſides; 14th, Of iſoperimetrical regular figures; 15th, Of equal regular figures; and 16th, Of the ſphere and the 5 regular bodies; which cloſes this introduction. Such of theſe problems as can admit of it, are determined by elegant geometrical conſtructions, and they are all illuſtrated by accurate arithmetical calculations performed by logarithms; for the exemplification of which they are purpoſely given.

At the end he remarks, that the chief and moſt neceſſary uſe of logarithms, is in the doctrine of ſpherical trigonometry, which he here promiſes to give in a future work, and which was accompliſhed in his *Trigonometria Britannica*, to the deſcription of which we now proceed.

Of BRIGGS's *Trigonometria Britannica.*

At the cloſe of the account of writings on the natural ſines, tangents, and ſecants, I omitted the deſcription of this work of our learned author, although it is perhaps the greateſt of this kind, all things conſidered, that ever was executed by one perſon; purpoſely reſerving my account of it to this place, not only as it is connected with the invention and conſtruction of logarithms, but thinking it

deſerved more peculiar and diſtinguiſhed notice, on account of the importance and originality of its contents. The diviſion of the quadrant, and the mode of conſtruction, are both new; and the numbers are far more accurate, and are extended to more places, than they had ever been before. The circular arcs had always been divided in a ſexageſimal proportion; but here the quadrant is divided into degrees and decimals, as this is a much eaſier mode of computation than by 60ths; the diviſion being compleated only to 100ths of degrees, though his deſign was to have extended it to 1000ths of degrees. And, beſides his own private opinion, he was induced to adopt this method of decimal diviſions, partly at the requeſt of other perſons, and partly perhaps from the authority of Vieta, pa. 29 *Calendarii Gregoriani*. And it is probable that computations by this decimal diviſion would have come into general uſe, had it not been for the publication of Vlacq's tables, which were extended to every 10 ſeconds, or 6th parts of minutes. But beſides this method by a decimal diviſion of the degrees, of which the whole circle contains 360, or the quadrant 90, in the 14th chapter he remarks that ſome other perſons were inclined rather to adopt a compleat decimal diviſion of the whole circle, firſt into 100 parts, and each of theſe into 1000 parts; and for *their* ſakes he ſubjoins a ſmall table of the ſines of every 40th part of the quadrant, and remarks that from theſe few the whole may be made out by continual quinquiſections; namely, 5 times theſe 40 make 200, then 5 times theſe give 1000, thirdly 5 times theſe give 5000, and laſtly 5 times theſe give 25000 for the whole quadrant, or 100000 for the whole circumference.

But to return. Our author's large table conſiſts of natural ſines to 15 places, natural tangents and ſecants each to 10 places, logarithmic ſines to 14 places, and logarithmic tangents to 10 places, each beſides the characteriſtic. A moſt ſtupendous performance! The table is preceded by an introduction, divided into two books, the one containing an account of the truly ingenious conſtruction of the table, by the author himſelf; and the other its uſes in trigonometry, &c, by Henry Gellibrand, profeſſor of aſtronomy in Greſham College, who remarks in the preface that the work was compoſed by the author about the year 1600; though it was only publiſhed by the direction of Gellibrand in 1633, it having been printed at Gouda under the care of Vlacq, and by the printer of his *Trigonometria Artificialis*, which came out the ſame year.

After briefly mentioning the common methods of dividing the quadrant, and conſtructing the tables of ſines, &c, from the ancients down to his own time, he haſtens to the deſcription of his own peculiar and truly ingenious method, which is briefly this: having firſt divided the quadrant into a ſmall number of parts, as 72, he finds the ſine of one of thoſe parts, then from it the ſines of the double, triple, quadruple, &c, up to the quadrant or 72 parts. He next quinquiſects each of theſe parts, by interpoſing four equidiſtant means, by differences; he then quinquiſects each of theſe; and finally each of theſe again; which compleats the diviſion as far as degrees and centeſims.

The

The rules for performing all theſe things, he inveſtigates and illuſtrates in a very ample manner. In treating of multiple and ſubmultiple arcs, he gives general algebraical expreſſions, for the ſine or chord of any multiple whatever of a given arc, which he deduced from a geometrical figure, by finding the law for the ſeries of ſucceſſive multiple chords or ſines, after the manner of Vieta, who was the firſt perſon that I know of, who laid down general rules for the chords of multiples and ſubmultiples of arcs or angles: and the ſame was afterwards improved by Sir I. Newton, to ſuch form, that radius, and double the coſine of the firſt given angle, are the firſt and ſecond terms of all the proportions for finding the ſines and coſines of the multiple angles. For aſſigning the coefficients of the terms in the multiple expreſſions, our author here delivers the conſtruction of figurate or polygonal numbers, inſerts a large table of them, and teaches their ſeveral uſes; one of which is that every other number taken in the diagonal lines, furniſhes the coefficients of the terms of the general equation by which the ſines and chords of multiple arcs are expreſſed, which he amply illuſtrates; and another, that the ſame diagonal numbers conſtitute the coefficients of the terms of any power of a binomial; which property was alſo mentioned by Vieta in his *Angulares Sectiones, theor.* 6, 7; and this is the firſt mention I have ſeen made of this law of the coefficients of the powers of a binomial, commonly called Sir I. Newton's binomial theorem, although it is very evident that Sir Iſaac was not the firſt inventor of it, the part of it properly belonging to him ſeems to be only the extending of it to fractional indices, which was indeed an immediate effect of the general method of denoting all roots like powers with fractional exponents, the theorem being not at all altered. However it appears that our author Briggs was the firſt who taught the rule for generating the coefficients of the terms, ſucceſſively one from another, of any power of a binomial, independent of thoſe of any other power. For having ſhewn, in his *Abacus* Παγχρηστος (which he ſo calls on account of its frequent and excellent uſe, and of which a ſmall ſpecimen is

ABACUS ΠΑΓΧΡΗΣΤΟΣ.

							9

here annexed,) that the numbers in the diagonal directions, aſcending from right to left, are the coefficients of the powers of binomials, the

indices being the figures in the firſt perpendicular column A, which are alſo the coefficients of the 2d terms of each power (thoſe of the firſt terms being 1, are here omitted;) and that any one of theſe diagonal numbers is in proportion to the next higher in the diagonal, as the vertical of the former is to the marginal of the latter, that is, as the uppermoſt number in the column of the former is to the firſt or right-hand number in the line of the latter; having ſhewn theſe things, I ſay, he thereby teaches the generation of the coefficients of any power, independently of all other powers, by the very ſame law or rule which we now uſe in the binomial theorem. Thus, for the 9th power; 9 being the coefficient of the 2d term, and 1 always that of the firſt, to find the 3d coefficient we have 2 : 8 :: 9 : 36; for the 4th term, 3 : 7 :: 36 : 84; for the 5th term, 4 : 6 :: 84 : 126; and ſo on for the reſt. That is to ſay, the coefficients of the terms in any power m, are inverſely as the vertical numbers or firſt line 1, 2, 3, 4, ... m, and directly as the aſcending numbers m, $m-1$, $m-2$, $m-3$, ... 1 in the firſt column A; and that conſequently thoſe coefficients are found by the continual multiplication of theſe fractions $\frac{m}{1}, \frac{m-1}{2}, \frac{m-2}{3}, \frac{m-3}{4}, \ldots\ldots \frac{1}{m}$, which is the very theorem as it ſtands at this day, and as applied by Newton to roots or fractional exponents, as it had before been uſed for integral powers. This theorem then being thus plainly taught by Briggs about the year 1600, I am ſurpriſed how a man of ſuch general reading as Dr. Wallis was, could poſſibly be ignorant of it, as he plainly appears to be by the 85th chapter of his algebra, where he fully aſcribes the invention to Newton, and adds that he himſelf had formerly ſought after ſuch a rule, but without ſucceſs: Or how Mr. John Bernoulli, not half a century ſince, could himſelf firſt diſpute the invention of this theorem with Newton, and then give the diſcovery of it to M. Paſcal, who was not born till long after it had been taught by Briggs. *See* Bernoulli's *Works*, *vol.* 4 *pa.* 173. But I do not wonder that Briggs's remark was unknown to Newton, who owed almoſt every thing to genius, and very little to reading: and I have no doubt that he made the diſcovery himſelf, without any light from Briggs, and that he thought it was new for all powers in general, as it was indeed for roots and quantities with fractional and irrational exponents.

When the above table of the ſums of figurate numbers is uſed by our author in determining the coefficients of the terms of the equation, whoſe root is the chord of any ſubmultiple of an arc, as when the ſection is expreſſed by any uneven number, he remarks that the powers of that chord or root will be the 1ſt, 3d, 5th, 7th, &c, in the alternate uneven columns, A, C, E, G, &c, with their ſigns + or — as marked to the powers, continued till the higheſt power be equal to the index of the ſection; and that the coefficients of thoſe powers are the ſums of two continuous numbers in the ſame column with the powers, beginning with 1 at the higheſt power, and gradually deſcending one line obliquely to the right at each lower

lower power: ſo for a triſection, the numbers are 1 in C, and 1 + 2 = 3 in A; and therefore the terms are — 1 ③ + 3 ①: for a quinquiſection, the numbers are 1 in E, 1 + 4 = 5 in C, 2 + 3 = 5 in A; ſo that the terms are 1⑤ − 5③ + 5①: for a ſeptiſection, the numbers are 1 in G, 1 + 6 = 7 in E, 4 + 10 = 14 in C, and 3 + 4 = 7 in A; and ſo the terms are — 1⑦ + 7⑤ — 14③ + 7①: and ſo on; the ſum of all theſe terms being always equal to the chord of the whole or multiple arc. But when the ſection is denominated by an even number, the ſquares of the chords enter the equation inſtead of the firſt powers as before, and the dimenſions of all the powers are doubled, the coefficients being found as before, and therefore the powers and numbers will be thoſe in the 2d, 4th, 6th, &c, columns: and the uneven ſections may alſo be expreſſed the ſame way: hence, for a biſection the terms will be — 1④ + 4②; for a triſection 1⑥ — 6④ + 9②; for the quadriſection — 1⑧ + 8⑥ — 20④ + 16②; for the quinquiſection 1⑩ — 10⑧ + 35⑥ — 50④ + 25②; and ſo on.

Our author alſo ſubjoins another table, a ſmall ſpecimen of which is here annexed, in which the firſt column conſiſts of the uneven numbers, 1, 3, 5, &c, the reſt being found by addition as before, and the alternate diagonal numbers themſelves are the coefficients.

The method is quite different from that of Vieta, who gives another table for the like purpoſe, a ſmall part of which is here annexed, which is formed by adding from the number 2 downwards obliquely towards the right; and the coefficients of the terms ſtand upon the horizontal line.

Theſe angular ſections were afterwards further diſcuſſed by Oughtred and Wallis. And the ſame theorems of Vieta and Briggs have been ſince given in a different form, by Meſſrs. Herman, and the Bernoullis, in the *Leipſic Acts*, and the *Memoirs of the Royal Academy of Sciences*. Theſe theorems they expreſſed by the alternate terms of the power of a binomial, whoſe exponent is that of the multiple angle or ſection. And Mr. De Lagny, in the ſame Memoirs, firſt ſhewed that the tangents and ſecants of multiple angles are alſo expreſſed by the terms of a binomial, in the form of a fraction, of which ſome of thoſe terms form the numerator, and others the denominator. Thus, if r expreſs the radius, s the ſine, c the coſine, t the tangent, and

and f the ſecant of the angle A; then the ſine, coſine, tangent, and ſecant of n times the angle, are expreſſed thus, *viz.*

$$\text{Sin. } nA = \frac{1}{r^{n-1}} \times : \frac{n}{1} c^{n-1} s - \frac{n.n-1.n-2}{1.2.3} c^{n-3} s^3 + \frac{n.n-1.n-2.n-3.n-4}{1.2.3.4.5} c^{n-5} s^5 \text{ \&c.}$$

$$\text{Coſine } nA = \frac{1}{r^{n-1}} \times : c^n - \frac{n.n-1}{1.2} c^{n-2} s^2 + \frac{n.n-1.n-2.n-3}{1.2.3.4} c^{n-4} s^4 \text{ \&c.}$$

$$\text{Tang. } nA = r \times \frac{\frac{n}{1} r^{n-1} t - \frac{n.n-1.n-2}{1.2.3} r^{n-3} t^3 + \frac{n.n-1.n-2.n-3.n-4}{1.2.3.4.5} r^{n-5} t^5 \text{ \&c.}}{r^n - \frac{n.n-1}{1.2} r^{n-2} t^2 + \frac{n.n-1.n-2.n-3}{1.2.3.4} r^{n-4} t^4 \text{ \&c.}}$$

$$\text{Sec. } nA = r \times \frac{f \text{ or } r^2 + t^2}{r^n - \frac{n.n-1}{1.2} r^{n-2} t^2 + \frac{n.n-1.n-2.n-3}{1.2.3.4} r^{n-4} t^4 \text{ \&c.}}$$

where it is evident that the ſeries in the ſine of nA conſiſts of the even terms of the power of the binomial $\overline{c+s}^n$, and the ſeries in the coſine of the uneven terms of the ſame power; alſo the ſeries in the numerator of the tangent conſiſts of the even terms of the power $\overline{r+t}^n$, and the denominator, both of the tangent and ſecant, conſiſts of the uneven terms of the ſame power $\overline{r+t}^n$. And if the diameter, chord, and chord of the ſupplement, be ſubſtituted for the radius, ſine and coſine, in the expreſſions for the multiple, ſine and coſine, the reſult will give the chord and chord of the ſupplement of n times the arc or angle A. Theſe and various other expreſſions for multiple and ſubmultiple arcs, with other improvements in trigonometry, have alſo been given by Euler and other eminent writers on the ſubject.

The before mentioned M. De Lagny offered a project for ſubſtituting, inſtead of the common logarithms, a binary arithmetic, which he called the *natural logarithms*, and which he and M. Leibnitz ſeem to have both invented about the ſame time, independently of each other: but the project came to nothing. Mr. De Lagny alſo publiſhed, in ſeveral Memoirs of the Royal Academy, a new method of determining the angles of figures, which he called *Goniometry*. It conſiſts in meaſuring with a pair of compaſſes the arc which ſubtends the angle in queſtion; however this arc is not meaſured by applying its extent to any preconſtructed ſcale, but by examining what part it is of half the circumference of the ſame circle, in this manner: from the propoſed angular point as a center, with a ſufficiently large radius, a ſemicircle being deſcribed, a part of which is the arc intercepted by the ſides of the propoſed angle, the extent of this arc is taken with a fine pair of compaſſes, and applied continually upon the arc of the ſemicircle, by which he finds how often it is contained in the ſemicircle, with uſually a ſmall arc remaining; in the ſame manner he meaſures how often this remaining arc is contained in the firſt arc, and what remains again is applied continually to the firſt re-

mainder

mainder, and ſo the 3d remainder to the 2d, the 4th to the 3d, and ſo on till there be no remainder, or elſe till it become inſenſibly ſmall. By this proceſs he obtains a ſeries of quotients, or fractional parts, one of another, which being properly reduced into one, give the ratio of the firſt arc to the ſemicircumference, or of the propoſed angle, to two right angles or 180 degrees, and conſequently that angle in degrees, minutes, &c, if required, and that commonly to a degree of accuracy far exceeding the calculation of the ſame by means of any tables of ſines, tangents or ſecants, notwithſtanding the apparent paradox in this expreſſion at firſt ſight. Thus, if the 1ſt arc be 4 times contained in the ſemicircle, the remainder once contained in the firſt arc, the next five times in the ſecond, and finally the fourth two times in the third: Here the quotients are 4, 1, 5, 2; conſequently the fourth or laſt arc was $\frac{1}{2}$ the 3d, therefore the 3d was $\frac{1}{5\frac{1}{2}}$ or $\frac{2}{11}$ of the 2d, and the 2d was $\frac{1}{1\frac{2}{11}}$ or $\frac{11}{13}$ of the 1ſt, and the firſt or arc ſought, was $\frac{1}{4\frac{11}{13}}$ or $\frac{13}{63}$ of the ſemicircle; and conſequently it contains $37\frac{1}{7}$ degrees, or $37^{\circ}\,8'\,34''\frac{2}{7}$.

But to return from this long digreſſion, Mr. Briggs next treats of interpolation by differences, and chiefly of quinquiſection, after the manner uſed in the 13th chapter of his conſtruction of logarithms before deſcribed. He here proves that curious property of the ſines and their ſeveral orders of differences, before mentioned, namely, that, of equidifferent arcs, the ſines, with the 2d, 4th, 6th, &c differences, are continued proportionals; as alſo the coſines of the means between thoſe arcs, and the 1ſt, 3d, 5th, &c differences. And to this treatiſe on interpolation by differences, he adds a marginal note, complaining that this 13th chapter of his *Arithmetica Logarithmica* had been omitted by Vlacq in his edition of it; as if he were afraid of an intention to deprive him of the honour of the invention of interpolation by ſucceſſive differences. The note is this: *Modus correctionis à me traditus eſt Arithmeticæ Logarithmicæ capite* 13, *in editione Lonidnenſi: Iſtud autem caput una cum ſequenti in editione Batava me inconſulto et inſcio omiſſum fuit: nec in omnibus, editionis illius author vir alioqui induſtrius et non indoctus meam mentem videtur aſſequutus: Ideoque ne quicquam deſit cuiquam, qui integrum canonem conficere cupiat: quædam maximè neceſſaria illinc huc transferenda cenſui.*

A large ſpecimen of quinquiſection by differences is then given, and he ſhews how it is to be applied to the conſtruction of the whole canon of ſines, both for 100th and 1000th parts of degrees; namely, for centeſms, divide the quadrant firſt into 72 equal parts, and find their ſines by the primary methods; then theſe quinquiſected give 360 parts, a ſecond quinquiſection gives 1800 parts, and a third gives 9000 parts, or centeſms of degrees: but for milleſms, divide the quadrant into 144 equal parts; then one quinquiſection gives 720, a ſecond gives 3600, a third 18000, and a fourth gives 90000 parts, or milleſms.

He next proceeds to the natural tangents and ſecants, which are directed to be raiſed in the ſame manner, by interpolations from a few primary ones, conſtructed from the known proportions between ſines, tangents, and ſecants; excepting that half the tangents and ſecants are to be formed by addition and ſubtraction only, by means of ſome ſuch theorems as theſe, namely, 1ſt, the ſecant of an arc is equal to the ſum of the tangent of the ſame arc, and the tangent of half its complement, which will find every other ſecant; 2d, double the tangent of an arc added to the tangent of half its complement, is equal to the tangent of the ſum of that arc and the ſaid half complement, by which rule half the tangents will be found; &c.

In the two remaining chapters of this book are treated the conſtruction of the logarithmic ſines, tangents, and ſecants. This is preceded by ſome remarks on the origin and invention of them. Our author here obſerves that logarithms may be of various kinds; that others had followed the plan of Baron Napier the firſt inventor, among whom Benjamin Urſinus is eſpecially commended, who applied Napier's logarithms to every ten ſeconds of the quadrant; but that he himſelf, encouraged by the noble inventor, deviſed other logarithms that were much eaſier and more excellent *. He ſays he put 10, with ciphers, for the logarithm of radius; 9 for the logarithm ſine of 5° 44′ whoſe natural ſine is one 10th of the radius; 8 for that of 34′, whoſe natural ſine is one 100th of the radius, &c.; thereby making 1 the logarithm of the ratio of 10 to 1, which is the characteriſtic of his ſpecies of logarithms.

To conſtruct the logarithmic ſines, he directs firſt to divide the quadrant into 72 equal parts as before, and to find the logarithms of their natural ſines as in the 14th chapter of his *Arithmetica Logarithmica*; after which this number will be increaſed by quinquiſection, firſt to 360, then to 1800, and laſtly to 9000, or centeſms of degrees. But if milleſms of degrees be required, divide the quadrant firſt into 144 equal parts, and then by four quinquiſections theſe will be extended to the following parts, 720, 3600, 18000, and 90000, or milleſms of degrees. He remarks however that the logarthmic ſines of only half the quadrant need be found in this manner, as the other half may be found by mere addition, or ſubtraction, by means of this theorem, as the ſine of half an arc is to half radius, ſo is the ſine of the whole arc to the coſine of the ſaid half arc. This theorem he illuſtrates with examples, and then adds a table of the logarthmic ſines of the primary 72 parts of the quadrant, from which the reſt are to be made out by quinquiſection.

In the next chapter our author ſhews the conſtruction of the natural tangents and ſecants more fully than he had done before, demonſtrating and illuſtrating ſeveral curious theorems for the eaſy finding of them. He then concludes this chapter, and the book, with

* His words are "Ego vero ipſius inventoris primi cohortatione adjutus, alios logarithmos applicandos cenſui, qui multo faciliorem uſum habent, præſtantiorem. Logarithmus radii circularis vel ſinus totius, a me ponitur 10 &c."

pointing

pointing out the very eaſy conſtruction of the logarithmic tangents and ſecants by means of theſe three theorems:

1ſt, As coſine : ſine :: radius : tangent,
2d, As tangent : radius :: radius : cotangent,
3d, As coſine : radius :: radius : ſecant.

So that in logarithms, the tangents are found by ſubtracting the coſines from the ſines, adding always 10 or the radius; the cotangents are found by ſubtracting always the tangents from 20 or double the radius; and the ſecants are found by ſubtracting the coſines from 20 the double radius.

The 2d book, by Gellibrand, contains the uſe of the canon in plane and ſpherical trigonometry.

Beſides Briggs's methods of conſtructing logarithms, above deſcribed, no others were given about that time. For as to the calculations made by Vlacq, his numbers being carried to comparatively but few places of figures, they were performed by the eaſieſt of Briggs's methods, and in the manner which this ingenious man had pointed out in his two volumes. Thus, the 70 chiliads of logarithms, from 20000 to 90000, computed by Vlacq, and publiſhed in 1628, being extended only to 10 places, yield no more than two orders of mean differences, which are alſo the correct differences, in quinquiſection, and therefore will be made out thus, namely, one-fifth of them by the mere addition of the conſtant logarithm of 5; and the other four-fifths of them by two eaſy additions of very ſmall numbers, namely, of the 1ſt and 2d differences, according to the directions given in Briggs's *Arith. Log.* c. 13. p. 31. And as to Vlacq's logarithmic ſines and tangents to every 10 ſeconds, they were eaſily computed thus; the ſines for half the quadrant were found by taking the logarithms to the natural ſines in Rheticus's canon; and then from theſe the logarithmic ſines to the other half quadrant were found by mere addition and ſubtraction; and from theſe all the tangents by one ſingle ſubtraction. So that all theſe operations might eaſily be performed by one perſon, as quickly as a printer could ſet up the types; and thus the computation and printing might both be carried on together. And hence it appears that there is no reaſon for admiration at the expedition with which theſe tables were ſaid to have been brought out.

Of certain Curves related to Logarithms.

About this time the mathematicians of Europe began to conſider ſome curves which have properties analogous to logarithms. Edmund Gunter, it has been ſaid, firſt gave the idea of a curve, whoſe abſciſſes are in arithmetical progreſſion, while the correſponding ordinates are in geometrical progreſſion, or whoſe abſciſſes are the logarithms of their ordinates; but I cannot find it noticed in any part of his writings. The ſame curve was afterwards conſidered by others, and named the *Logarithmic* or *Logiſtic* curve by Huygens in his *Diſ-*

ſertatio de Cauſa Gravitatis, where he enumerates all the principal properties of this curve, ſhewing its analogy to logarithms. Many other learned men have alſo treated of its properties; particularly Le Seur and Jacquier in their comment on Newton's Principia; Dr. John Kiell in the elegant little tract on logarithms ſubjoined to his edition of Euclid's Elements; and Francis Maſeres, Eſq. Curſitor Baron of the Exchequer, in his ingenious treatiſe on Trigonometry; in which books the doctrine of logarithms is copiouſly and learnedly treated, and their analogy to the logarithmic curve &c fully diſplayed. —It is indeed rather extraordinary that this curve was not ſooner announced to the public; ſince it reſults immediately from baron Napier's manner of conceiving the generation of logarithms, by only ſuppoſing the lines which repreſent the natural numbers to be placed at right angles to that upon which the logarithms are taken. This curve greatly facilitates the conception of logarithms to the imagination, and affords an almoſt intuitive proof of the very important property of their fluxions, or very ſmall increments, to wit, that the fluxion of the number is to the fluxion of the logarithm, as the number is to the ſubtangent; as alſo of this property, that, if three numbers be taken very nearly equal, ſo that their ratios to each other may differ but a little from a ratio of equality, as for example, the three numbers 10000000, 10000001, 10000002, their differences will be very nearly proportional to the logarithms of the ratios of thoſe numbers to each other: all which follows from the logarithmic arcs being very little different from their chords, when they are taken very ſmall. And the conſtant ſubtangent of this curve is what was afterwards by Cotes called the *Modulus* of the ſyſtem of logarithms: and ſince, by the former of the two properties abovementioned, this ſubtangent is a 4th proportional to the fluxion of the number, the fluxion of the logarithm, and the number, this property afforded occaſion to Mr. Baron Maſeres to give the following definition of the modulus, which is the ſame in effect as Cotes's, but more clearly expreſſed, namely, that it is the limit of the magnitude of a 4th proportional to theſe three quantities, to wit, the difference of any two natural numbers that are very nearly equal to each other, either of the ſaid numbers, and the logarithm or meaſure of the ratio they have to each other. Or we may define the modulus to be the natural number at that part of the ſyſtem of logarithms, where the fluxion of the number is equal to the fluxion of the logarithm, or where the numbers and logarithms have equal differences. And hence it follows, that the logarithms of equal numbers or of equal ratios, in different ſyſtems, are to oneanother as the *moduli* of thoſe ſyſtems. Moreover, the ratio whoſe meaſure or logarithm is equal to the modulus, and thence by Cotes called the *ratio modularis*, is by calculation found to be the ratio of 2·718281828459 &c to 1, or of 1 to ·367879441171 &c; the calculation of which number may be ſeen at full length in Mr. baron Maſeres's treatiſe on the Principles of Life-annuities, pa. 274 and 275.

The

The hyperbolic curve alſo afforded another ſource for developing and illuſtrating the properties and conſtruction of logarithms. For the hyperbolic areas lying between the curve and one aſymptote, when they are bounded by ordinates parallel to the other aſymptote, are analogous to the logarithms of their abſciſſes or parts of the aſymptote. And ſo alſo are the hyperbolic ſectors; any ſector bounded by an arc of the hyperbola and two radii, being equal to the quadrilateral ſpace bounded by the ſame arc, the two ordinates to either aſymptote from the extremities of the arc, and the part of the aſymptote intercepted between them. And although Napier's logarithms are commonly ſaid to be the ſame as hyperbolic logarithms, it is not to be underſtood that hyperbolas exhibit Napier's logarithms only, but indeed all other poſſible ſyſtems of logarithms whatever. For, like as the right-angled hyperbola, the ſide of whoſe ſquare inſcribed at the vertex is 1, gives us Napier's logarithms; ſo any other ſyſtem of logarithms is expreſſed by the hyperbola whoſe aſymptotes form a certain oblique angle, the ſide of the rhombus inſcribed at the vertex of the hyperbola in this caſe alſo being ſtill 1, the ſame as the ſide of the ſquare in the right-angled hyperbola. But the areas of the ſquare and rhombus, and conſequently the logarithms of any one and the ſame number or ratio, will differ according to the ſine of the angle of the aſymptotes. And the area of the ſquare or rhombus, or any inſcribed parallelogram, is alſo the ſame thing as what was by Cotes called the modulus of the ſyſtem of logarithms; which modulus will therefore be expreſſed by the numerical meaſure of the ſine of the angle formed by the aſymptotes, to the radius 1; as that is the ſame with the number expreſſing the area of the ſaid ſquare or rhombus, the ſide being 1: which is another definition of the modulus to be added to thoſe we before remarked above in treating of the logarithmic curve. And the evident reaſon of this is, that in the beginning of the generation of theſe areas from the vertex of the hyperbola, the naſcent increment of the abſciſſe drawn into the altitude 1, is to the increment of the area, as radius is to the ſine of the angle of the ordinate and abſciſſe, or of the aſymptotes; and at the beginning of the logarithms, the naſcent increment of the natural numbers is to the increment of the logarithms, as 1 is to the modulus of the ſyſtem. Hence we eaſily diſcover that the angle formed by the aſymptotes of the hyperbola exhibiting Briggs's ſyſtem of logarithms, will be 25 deg. 44 min. 25½ ſec. this being the angle whoſe ſine is 0·4342944819 &c, the modulus of this ſyſtem.

Or indeed any one hyperbola, as has been remarked by Mr. baron Maſeres, will expreſs all poſſible ſyſtems of logarithms whatever, namely, if the ſquare or rhombus inſcribed at the vertex, or, which is the ſame thing, any parallelogram inſcribed between the aſymptotes and the curve at any other point, be expounded by the modulus of the ſyſtem; or, which is the ſame, by expounding the area, intercepted between two ordinates which are to each other in the ratio of 10 to 1, by the logarithm of that ratio in the propoſed ſyſtem.

As to the firſt remarks on the analogy between logarithms and the hyperbolic ſpaces; it having been ſhewn by Gregory St. Vincent, in his *Quadratura Circuli & Sectionum Coni*, publiſhed at Antwerp in 1647, that if one aſymptote be divided into parts in geometrical progreſſion, and from the points of diviſion ordinates be drawn parallel to the other aſymptote, they will divide the ſpace between the aſymptote and curve into equal portions; from hence it was ſhewn by Merſennus, that, by taking the continual ſums of thoſe parts, there would be obtained areas in arithmetical progreſſion, adapted to abſciſſes in geometrical progreſſion, and which therefore were analogous to a ſyſtem of logarithms. And the ſame analogy was remarked and illuſtrated ſoon after by Huygens and many others, who ſhew how to ſquare the hyperbolic ſpaces by means of the logarithms.

*Of *Gregory's Computation of Logarithms.*

On the other hand, Mr. James Gregory, in his *Vera Circuli* and *Hyperbolæ Quadratura*, firſt printed at Patavi, or Padua, in the year 1667, having approximated to the hyperbolic aſymptotic ſpaces by means of a ſeries of inſcribed and circumſcribed polygons, from thence ſhews how to compute the logarithms, which are analogous to thoſe areas: and thus the quadrature of the hyperbolic ſpaces became the ſame thing as the computation of the logarithms. He here alſo lays down various methods to abridge the computation, with the aſſiſtance of ſome properties of numbers themſelves, by which we are enabled to compoſe the logarithms of all prime numbers under 1000, each by one multiplication, two diviſions, and the extraction of the ſquare root. And the ſame ſubject is farther purſued in his *Exercitationes Geometricæ*, to be deſcribed hereafter.

There are alſo innumerable other geometrical figures having properties analogous to logarithms; ſuch as the equiangular ſpiral, the figures of the tangents and ſecants, &c; which it is not to our purpoſe to diſtinguiſh more particularly.

Of †Mercator's Logarithmotechnia.

In 1668, Nicholas Mercator publiſhed his *Logarithmotechnia, ſive methodus conſtruendi Logarithmos nova, accurata, & facilis*; in which he delivers a new and ingenious method for computing the logarithms upon principles purely arithmetical; which being curious and very

* James Gregory was born at Aberdeen in Scotland 1639, where he was educated. He was profeſſor of Mathematics in the college of St. Andrews; and died of a fever in December 1675, being only 36 years of age.

† Nicholas Mercator, a learned mathematician, and an ingenious member of the Royal Society, was a native of Holſtein in Germany, but ſpent moſt of his time in England, where he died in the year 1690, at about 50 years of age. He was the author of many other works in Geometry, Geography, Aſtronomy, Aſtrology, &c.

accurately

accurately performed, I ſhall here give a rather full and particular account of that little tract, as well as of the ſmall ſpecimen of the quadrature of curves by infinite ſeries ſubjoined to it; and more eſpecially as this work gave occaſion to the public communication of ſome of Sir Iſaac Newton's earlieſt pieces, to evince that he had not borrowed them from this publication. So it appears that theſe two ingenious men had, independent of each other, in ſome inſtances fallen upon the ſame things.

Our author begins this work with remarking that the word *Logarithm* is compoſed of the words *ratio* and *number*, being as much as to ſay the *number of ratios*; which he obſerves is quite agreeable to the nature of them, for that a logarithm is nothing elſe but the number of *ratiunculæ* contained in the ratio which any number bears to unity. He then makes a very learned and critical diſſertation on the nature of ratios, their magnitude and meaſure, conveying a clearer idea of the nature of logarithms than had been given by either Napier or Briggs, or any other writer except the famous Kepler, in his work before deſcribed, although thoſe other writers ſeem indeed to have had in their own minds the ſame ideas on the ſubject as Kepler and Mercator, but without having expreſſed them ſo clearly. Our author indeed pretty cloſely follows Kepler in his modes of thinking and expreſſion, and after him in plain and expreſs terms calls logarithms the meaſures of ratios; and, in order to the right underſtanding that definition of them, he explains what he means by the magnitude of a ratio. This he does pretty fully, but not too fully, conſidering the nicety and ſubtlety of the ſubject of ratios, their magnitude, with their addition to, and ſubtraction from, each other, which have been miſconceived by very learned mathematicians, who have thence been led into conſiderable miſtakes. Witneſs the overſight of Gregory St. Vincent, which Huygens animadverted upon in the *Exercit. Cyclometriæ Gregorii a Sancto Vincentio*, and which aroſe from not underſtanding, or not adverting to, the nature of ratios, and their proportions one to another. And many other ſimilar miſtakes might here be adduced of other eminent writers. From all which we muſt commend the propriety of our author's attention, in ſo judiciouſly diſcriminating between the magnitude of a ratio, as of a to b, and the fraction $\frac{a}{b}$, or quotient ariſing from the diviſion of one term of the ratio by the other; which latter method of conſideration is always attended with danger of errors and confuſion on the ſubject; though in the 5th definition of the 6th book of Euclid this quotient is accounted the quantity of the ratio; but this definition is probably not genuine, and therefore very properly omitted by profeſſor Simſon in his edition of the Elements. And in thoſe ideas on the ſubject of logarithms, Kepler and Mercator have been followed by Halley, Cotes, and moſt other eminent writers ſince that time.

Purely from the above idea of logarithms, namely as being the meaſures of ratios, and as expreſſing the number of *ratiunculæ* contained in any ratio, or into which it may be divided, the number of the

the like equal *ratiunculæ* contained in ſome one ratio, as of 10 to 1, being ſuppoſed given, our author ſhews how the logarithm or meaſure of any other ratio may be found. But this however only by-the-bye, as not being the principal method he intends to teach, as his laſt and beſt, and which we arrive not at till near the end of the book, as we ſhall ſee below. Having ſhewn then, that theſe logarithms, or numbers of ſmall ratios, or meaſures of ratios, may be all properly repreſented by numbers, and that of 1, or the ratio of equality, the logarithm or meaſure being always 0, the logarithm of 10, or the meaſure of the ratio of 10 to 1, is moſt conveniently repreſented by 1 with any number of ciphers; he then proceeds to ſhew how the meaſures of all other ratios may be found from this laſt ſuppoſition. And he explains the principles by the two following examples.

Firſt, to find the logarithm of 100·5*, or to find how many *ratiunculæ* are contained in the ratio of 100·5 to 1, the number of *ratiunculæ* in the decuple ratio, or ratio of 10 to 1, being 1,0000000.

The given ratio 100·5 to 1, he firſt divides into its parts, namely 100·5 to 100, 100 to 10, and 10 to 1; the laſt two of which being decuples, it follows that the characteriſtic will be 2, and it only remains to find how many parts of the next decuple belong to the firſt ratio of 100·5 to 100. Now if each term of this ratio be multiplied by itſelf, the products will be in the duplicate ratio of the firſt terms, or this laſt ratio will contain a double number of parts; and if theſe be multiplied by the firſt terms again, the ratio of the laſt products will contain three times the number of parts; and ſo on, the number of times of the firſt parts contained in the ratio of any like powers of the firſt terms, being always denoted by the exponent of the power. If therefore the firſt terms, 100·5 and 100, be continually multiplied till the ſame powers of them have to each other a ratio whoſe meaſure is known, as ſuppoſe the decuple ratio 10 to 1, whoſe meaſure is 1,0000000; then the exponent of that power ſhews what multiple this meaſure 1,0000000, of the decuple ratio, is of the required meaſure of the firſt ratio 100·5 to 100; and conſequently dividing 1,0000000 by that exponent, the quotient is the meaſure of the ratio 100·5 to 100 ſought. The operation for finding this, he ſets down as here follows; where the ſeveral multiplications are all performed in the contracted way by inverting the figures of the multiplier, and retaining only the firſt number of decimals in each product.

power

* Mercator diſtinguiſhes his decimals from integers thus 100[5, or thus 100|5.

	power
100·5000	1
5001	1
1005000	
5025	
1010025	2
5200101	2
1010025	
10100	
20	
5	
1020150	4
0510201	4
1020150	
20405	
102	
51	
1040706	8
6070401	8
1083068	16
8603801	16
1173035	32
5303711	32
1376011	64
1106731	64
1893406	128
6043981	128
3584985	256
5894853	256
1.2852116	512

This power being greater than the decuple of the like power of 100, which muſt always be 1 with ciphers, reſume therefore the 256th power, and multiply it, not by itſelf, but by the next before it, viz. by the 128th, thus

3584985	256
6043981	128
6787831	384
1106731	64
9340130	448
5303711	32
10956299	480

This power again exceeding the ſame power of 100 more than 10 times, I therefore draw the ſame 448th, not into the 32d, but the next preceding, thus

9340130	448
8603801	16
10115994	464

This being again too much, inſtead of the 16th, draw it into the 8th, or next preceding, thus

9340130	448
6070401	8
9720329	456
0510201	4
9916193	460
5200101	2
10015603	462

Which power again exceeds the limit; therefore draw the 460th into the 1ſt thus

9916193	460
5001	1
9965774	461

Since therefore the 462d power of 100·5 is greater, and the 461ſt power is leſs, than the decuple of the ſame power of 100; I find that the ratio of 100·5 to 100 is contained in the decuple more than 461 times, but leſs than 462 times. Again,

Since the { 460 / 461 / 462 } power is { 9916193 / 9965774 / 10015603 } and the differences { 49581 nearly equal / 49829 }

therefore the proportional part which the exact power, or 10000000, exceeds the next leſs 9965774, will be eaſily and accurately found by the Golden Rule, thus:

The juſt power	10000000
and the next leſs	9965774
the difference	34226; then

As 49829 the dif. between the next leſs and greater,
: To 34226 the dif. between the next leſs and juſt,
:: So is 10000: to 6868, the decimal parts; and therefore the ratio of 100·5 to 100, is 461·6868 times contained in the decuple or ratio of 10 to 1. Dividing now 1,0000000, the meaſure of the decuple ratio, by 461·6868, the quotient 00216597 is the meaſure of the ratio of 100·5 to 100; which being added to 2 the meaſure of

100 to 1, the ſum 2,00216597 is the meaſure of the ratio of 100·5 to 1, that is the log. of 100·5 is 2,00216597.

In the ſame manner he next inveſtigates the log. of 99·5, and finds it to be 1,99782307.

A few obſervations are then added, calculated to generalize the conſideration of ratios, their magnitude and affections. It is here remarked that he conſiders the magnitude of the ratio between two quantities as the ſame, whether the antecedent be the greater or the leſs of the two terms: ſo the magnitude of the ratio of 8 to 5, is the ſame as of 5 to 8; that is by the magnitude of the ratio of either to the other, is meant the number of *ratiunculæ* between them, which will evidently be the ſame whether the greater or leſs term be the antecedent. And he farther remarks that of different ratios, when we divide the greater term of each ratio by the leſs, that ratio is of the greater maſs or magnitude which produces the greater quotient, *et vice verſa*; although thoſe quotients are not proportional to the maſſes or magnitudes of the ratios. But when he conſiders the ratio of a greater term to a leſs, or of a leſs to a greater, that is to ſay, the ratio of greater or leſs inequality, as abſtracted from the magnitude of the ratio, he diſtinguiſhes it by the word *affection*, as much as to ſay greater or leſs affection, ſomething in the manner of poſitive and negative quantities, or ſuch as are affected with the ſigns + and — . . . . . The remainder of this work he delivers in ſeveral propoſitions, as follows.

Prop. 1. In ſubtracting from each other two quantities of the ſame affection, to wit, both poſitive, or both negative; if the remainder be of the ſame affection with the two given, then is the quantity ſubtracted the leſs of the two, or expreſſed by the leſs number; but if the contrary, it is the greater.

Prop. 2. In any continued ratios, as $\frac{a}{a+b}$, $\frac{a+b}{a+2b}$, $\frac{a+2b}{a+3b}$, &c, (by which is meant the ratios of a to $a+b$, $a+b$ to $a+2b$, $a+2b$ to $a+3b$, &c,) of equidifferent erms, the antecedent of each ratio being equal to the conſequent of the next preceding one, and proceeding from leſs terms to greater; the meaſure of each ratio will be expreſſed by a greater quantity than that of the next following; and the ſame through all their orders of differences, namely, the 1ſt, 2d, 3d, &c, differences; but the contrary when the terms of the ratios decreaſe from greater to leſs.

Prop. 3. In any continued ratios of equidifferent terms, if the 1ſt or leaſt be a, the difference between the 1ſt and 2d b, and c, d, e, &c, the reſpective firſt term of their 2d, 3d, 4th, &c, differences; then ſhall the ſeveral quantities themſelves be as in the annexed

ſcheme;

ſcheme; where each term is compoſed of the firſt term together with as many of the differences as it is diſtant from the firſt term, and to thoſe differences joining, for coefficients, the numbers in the ſloping or oblique lines contained in the annexed table of figurate numbers, in the ſame manner, he obſerves, as the ſame figurate numbers compleat the powers raiſed from a binomial root, as had long before been taught by others. He alſo remarks that this rule not only gives any one term, but alſo the ſum of any number of ſucceſſive terms from the beginning, making the 2d coefficient the firſt, the 3d the 2d, and ſo on; thus, the ſum of the firſt 5 terms is $5a + 10b + 10c + 5d + e$.

1ſt term	a
2d	$a + b$
3d	$a + 2b + c$
4th	$a + 3b + 3c + d$
5th	$a + 4b + 6c + 4d + e$
&c.	&c.

1	1	1	1	1	1	1	1	1
1	2	3	4	5	6	7	8	9
1	3	6	10	15	21	28	36	
1	4	10	20	35	56	84		
1	5	15	35	70	126			
1	6	21	56	126				
1	7	28	84					
1	8	36						
1	9							

In the 4th *prop.* it is ſhewn that if the terms decreaſe, proceeding from the greater to the leſs, the ſame theorems hold good, by only changing the ſign of every other term, as in the margin.

1ſt term	a
2d	$a - b$
3d	$a - 2b + c$
4th	$a - 3b + 3c - d$
5th	$a - 4b + 6c - 4d + e$
&c.	&c.

Prop. 6 and 7 treat of the approximate multiplication and diviſion of ratios, or, which is the ſame thing, the finding nearly any powers or any roots of a given fraction, in an eaſy manner. The theorem for raiſing any power, when reduced to a ſimpler form, is this, the m power of $\frac{a}{b}$, or $\left|\frac{a}{b}\right|^m$ is $= \frac{s \mp md}{s \pm md}$ nearly, where s is $= a + b$, and $d = a \sim b$, the ſum and difference of the two numbers, and the upper or under ſigns take place according as $\frac{a}{b}$ is a proper or an improper fraction, that is according as a is leſs or greater than b. And the theorem for extracting the mth root of $\frac{a}{b}$ is $\sqrt[m]{\frac{a}{b}}$ or $\left|\frac{a}{b}\right|^{\frac{1}{m}} = \frac{ms \mp d}{ms \pm d}$ nearly; which latter rule is alſo the ſame as the former, as will be evident by ſubſtituting $\frac{1}{m}$ inſtead of m in the firſt theorem. So that univerſally $\left|\frac{a}{b}\right|^{\frac{n}{m}}$ is $= \frac{ns \mp md}{ms \pm md}$ nearly. Theſe theo-

rems however are nearly true only in ſome certain caſes, namely when $\frac{a}{b}$ and $\frac{m}{n}$ do not differ greatly from unity. And in the 7th *prop.* the author ſhews how to find nearly the error of the theorems.

In the 8th *prop.* it is ſhewn that the meaſures of ratios of equidifferent terms, are nearly reciprocally as the arithmetical means between the terms of each ratio. So of the ratios $\frac{16}{18}$, $\frac{33}{35}$, $\frac{50}{52}$, the mean between the terms of the firſt ratio is 17, of the 2d 34, of the 3d 51, and the meaſures of the ratios are nearly as $\frac{1}{17}$, $\frac{1}{34}$, $\frac{1}{51}$.

From this property he proceeds, in the 9th *prop.* to find the meaſure of any ratio leſs than $\frac{99.5}{100.5}$, which has an equal difference (1) of terms. In the two examples, mentioned near the beginning, our author found the logarithm or meaſure of the ratio, of $\frac{99.5}{100}$, to be $21769\frac{3}{10}$, and that of $\frac{100}{100.5}$ to be $21659\frac{7}{10}$; therefore the ſum 43429 is the logarithm of $\frac{99.5}{100.5}$, or $\frac{99.5}{100} \times \frac{100}{100.5}$; or the logarithm of $\frac{99.5}{100.5}$ is nearer 43430, as found by other more accurate computations.—Now to find the logarithm of $\frac{100}{101}$, having the ſame difference of terms (1) with the former; it will be, by prop. 8, as 100.5 (the mean between 101 and 100) : 100 (the mean between 99·5 and 100·5) :: 43430 : 43213 the logarithm of $\frac{100}{101}$, or the difference between the logarithms of 100 and 101. But the log. of 100 is 2; therefore the logarithm of 101 is 2,0043213.———Again, to find the logarithm of 102, we muſt firſt find the logarithm of $\frac{101}{102}$; the mean between its terms being 101·5, therefore as 101·5 : 100 :: 43430 : 42788 the logarithm of $\frac{101}{102}$, or the difference of the logarithms of 101 and 102. But the logarithm of 101 was found above to be 2,0043213; therefore the logarithm of 102 is 2,0086001.—So that dividing continually 868596 (the double of 434298 the logarithm of $\frac{99.5}{100.5}$ or $\frac{199}{201}$) by each number of the ſeries 201, 203, 205, 207, &c, then add 2 to the 1ſt quotient, to the ſum add the 2d quotient, and ſo on, adding always the next quotient to the laſt ſum, the ſeveral ſums will be the reſpective logarithms of the numbers in this ſeries 101, 102, 103, 104, &c.

The next, or *prop.* 10, ſhews that, of two pair of continued ratios whoſe terms have equal differences, the difference of the meaſures of the firſt two ratios, is to the difference of the meaſures of the other two, as the ſquare of the common term in the two latter, is to that in the former, nearly. Thus, in the four ratios $\frac{a}{a+b}$, $\frac{a+b}{a+2b}$, $\frac{a+3b}{a+4b}$, $\frac{a+4b}{a+5b}$, as the meaſure of $\frac{aa+2ab}{\overline{a+b}^2}$ (the difference of the firſt two, or the quotient of the two fractions) : the meaſure of $\frac{aa+8ab+15bb}{\overline{a+4b}^2}$ :: $\overline{a+4b}^2$: $\overline{a+b}^2$, nearly.

In

In *prop.* 11 the author ſhews that ſimilar properties take place among two ſets of ratios conſiſting each of 3 or 4 &c continued numbers.

Prop. 12 ſhews that, of the powers of numbers in arithmetical progreſſion, the orders of differences which become equal, are the 2d differences in the ſquares, the 3d differences in the cubes, the 4th differences in the 4th powers, &c. And from hence it is ſhewn how to conſtruct all thoſe powers by the continual addition of their differences. As had been long before more fully explained by Briggs.

In the next, or 13th *prop.* our author explains his compendious method of raiſing the tables of logarithms, ſhewing how to conſtruct the logarithms by addition only, from the properties contained in the 8th, 9th, and 12th propoſitions. For this purpoſe he makes uſe of the quantity $\frac{a}{b-c}$, which by diviſion he reſolves into this infinite ſeries $\frac{a}{b}+\frac{ac}{bb}+\frac{ac^2}{b^3}+\frac{ac^3}{b^4}$ &c *(in infin.)* Putting then $a = 100$ the arithmetical mean between the terms of the ratio $\frac{99.5}{100.5}$, $b=100000$, and c ſucceſſively equal to 0·5, 1·5, 2·5, &c. that ſo $b-c$ may be reſpectively equal to 99999·5, 99998·5, 99997·5, &c, the correſponding means between the terms of the ratios $\frac{99999}{100000}$, $\frac{99998}{99999}$, $\frac{99997}{99998}$, &c, it is evident that $\frac{a}{b-c}$ will be the quotient of the 2d term divided by the 1ſt in the proportions mentioned in the 8th and 9th propoſitions; and when each of theſe quotients are found, it remains then only to multiply them by the conſtant 3d term 43429, or rather 43429·8, of the proportion, to produce the logarithms of the ratios $\frac{99999}{100000}$, $\frac{99998}{9999}$, $\frac{99997}{99998}$, &c, till $\frac{10000}{10001}$; then adding theſe continually to 4 the logarithm of 10000 the leaſt number, or ſubtracting them from 5 the logarithm of the higheſt term 100000, there will reſult the logarithms of all the abſolute numbers from 10000 to 100000. Now when c is $= 0.5$, then

$\frac{a}{b}=$·001, $\frac{ac}{bb}=$·000000005, $\frac{ac^2}{b^3}=$·000000000000025, $\frac{ac^3}{b^4}=$·000000000000000000125,

&c; therefore $\frac{a}{b-c} = \frac{a}{b}+\frac{ac}{bb}+\frac{ac^2}{b^3}$ &c is $=$·001000005000025000125,

In like manner, if $c=1.5$, then $\frac{a}{b+c}$ will be $=$·001000015000225003375;

and if $c=2.5$, then $\frac{a}{b-c}$ will be $=$·001000025000625015625;

&c. But inſtead of conſtructing all the values of $\frac{a}{b-c}$ in the uſual way of raiſing the powers, he directs them to be found by addition

tion only, as in the laſt propoſiion. Having thus found all the values of $\frac{a}{b-c}$, the author then ſhews that they may be drawn into the conſtant logarithm 43429 by addition only, by the help of the annexed table of the firſt 9 products of it.

1	43429
2	86858
3	130287
4	173716
5	217145
6	260574
7	304003
8	347432
9	390861

The author then diſtinguiſhes which of the logarithms it may be proper to find in this way, and which from their component parts. Of theſe the logarithms of all even numbers need not be thus computed, being compoſed from the number 2; which cuts off one half of the numbers: neither are thoſe numbers to be computed which end in 5, becauſe 5 is one of their factors; theſe laſt are $\frac{1}{10}$ of the numbers; and the two together $\frac{1}{2}+\frac{1}{10}$ make $\frac{3}{5}$ of the whole: and of the other $\frac{2}{5}$, the $\frac{1}{3}$ of them, or $\frac{2}{15}$ of the whole, are compoſed of 3; and hence $\frac{3}{5}+\frac{2}{15}$, or $\frac{11}{15}$ of the numbers, are made up of ſuch as are compoſed of 2, 3, and 5. As to the other numbers which may be compoſed of 7, of 11, &c; he recommends to find *their* logarithms in the general way, the ſame as if they were incompoſites, as it is not worth while to ſeparate them in ſo eaſy a mode of calculation. So that of the 90 chiliads of numbers from 10000 to 100000, only 24 chiliads are to be computed. Neither indeed are all of theſe to be calculated from the foregoing ſeries for $\frac{a}{b-c}$, but only a few of them in that way, and the reſt by the proportion in the 8th propoſition. Thus having computed the logarithms of 10003 and 10013, omitting 10023 as being diviſible by 3, eſtimate the logarithms of 10033 and 10043, which are the 30th numbers from 10003 and 10013; and again omitting 10053, a multiple of 3, find the logarithms of 10063 and 10073. Then by prop. 8,

As 10048, the arithmetical mean between 10033 and 10063,
to 10018, the arithmetical mean between 10003 and 10033,
ſo 13006, the difference between the logarithms of 10003 and 10033,
to 12967, the difference between the logarithms of 10033 and 10063;

That is, 1ſt - - - As $\left\{\begin{matrix}10048\\10078\\10108\end{matrix}\right\}$: 10018 :: 13006 : $\left\{\begin{matrix}12967\\\&c.\end{matrix}\right.$

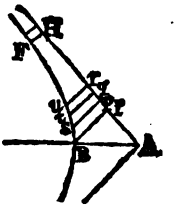
Again, As $\left\{\begin{matrix}10058\\10088\\10118\end{matrix}\right\}$: 10028 :: 12992 : $\left\{\begin{matrix}12953\\\&c.\end{matrix}\right.$

And 3dly, As $\left\{\begin{matrix}10068\\10098\\\&c\end{matrix}\right\}$: 10038 :: 12979 : $\left\{\begin{matrix}12940\\\&c.\end{matrix}\right.$

And with this our author concludes his compendium for conſtructing the tables of logarithms.

He afterwards ſhews ſome applications and relations of the doctrine of logarithms to geometrical figures: in order to which, in

prop.



prop. 14 he proves algebraically that, in the right-angled hyperbola, if from the vertex and from any other point there be drawn BI, FH perpendicular to the aſymptote AH, or parallel to the other aſymptote; then will AH : AI : : BI : FH. And

In *prop.* 15, if AI = BI = 1, and HI = a; then will FH = $\frac{1}{1+a}$ = $1-a+a^2-a^3+a^4-a^5$ &c *in infinitum*, by a continual algebraic diviſion, the proceſs of which he deſcribes ſtep by ſtep as a thing that was new or uncommon. But that method of diviſion had been taught before by Dr. Willis in his *Opus Arithmeticum*.

Prop. 16 is this: Any given number being ſuppoſed to be divided into innumerable ſmall equal parts, it is required to aſſign the ſum of any powers of the continual ſums of thoſe innumerable parts. For which purpoſe he lays down this rule; if the next higher power of the given number, above that power whoſe ſum is ſought, be divided by its exponent, the quotient will be the ſum of the powers ſought. That is, if N be the given number, and a one of its innumerable equal parts, then will

$a^n+\overline{2a}^n+\overline{3a}^n+\overline{4a}^n$ &c .... N^n be = $\frac{N^{n+1}}{n+1}$: which theorem he demonſtrates by a method of induction. And this, it is evident, is the finding the ſum of any powers of an infinite number of arithmeticals, of which the greateſt term is a given quantity, and the leaſt indefinitely ſmall. It is alſo remarkable that the above expreſſion is ſimilar to the rule for finding the fluent to the given fluxion of a power, as afterwards taught by Sir I. Newton.

Our author then applies this rule in *prop.* 17, to the quadrature of the hyperbola. Thus, putting AI = 1, conceive the aſymptote to be divided from I into innumerable equal parts, namely Ip = pq = qr = a; then, by the 14th and 15th,

ps = $1-a+a^2-a^3$ &c
qt = $1-2a+4a^2-8a^3$ &c
ru = $1-3a+9a^2-27a^3$ &c
} But the area BIru is = the ſum ps + qt + ru, which is =

$3-6a+14a^2-36a^3$ &c, that is, equal to the number of terms contained in the line Ir, minus the ſum of thoſe terms, plus the ſum of the ſquares of the ſame, minus the ſum of their cubes, plus the ſum of the 4th powers, &c. Putting now IA = 1, as before, and Ip = 0·1 the number of terms, to find the area BIps; by prop. 16 the ſum of the terms will be $\frac{0\cdot1^2}{2}$ = ·005, the ſum of their ſquares = ·000333333, the ſum of their cubes ·000025, the ſum of the 4th powers = ·000002, the ſum of the 5th powers = ·000000166, the ſum of the 6th powers = ·000000014, &c. Therefore the area BIps is = 1 — ·005 + ·000333333 — ·000025 + ·000002 — ·000000166 + ·000000014 &c. = ·100335347 — ·005025166 = ·095310181 &c.

Again, putting Iq = ·21 the number of terms, he finds in like manner the area BIqt = ·21 — ·02205 + ·003087 — ·000486202 + ·000081682

·000081682 — ·000014294 + ·000002572 — ·000000472 + ·000000088 &c = ·213171345 — ·022550984 = :190620361 &c.

He then adds, hence it appears that, as the ratio of AI to Ap, or 1 to 1·1, is half or ſubduplicate of the ratio of AI to Aq, or 1 to 1·21, ſo the area BIps is here found to be half of the area BIqt. Theſe areas he computes to 44 places of figures, and finds them ſtill in the ratio of 2 to 1.

The foregoing doctrine amounts to this, that if the rectangle BI × Ir, which in this caſe is expreſſed by Ir only, be put = A, AI being = 1 as before; then the area BIru, or the hyperbolic logarithm of $1 + A$, or of the ratio of 1 to $1 + A$, will be equal to the infinite ſeries $A - \frac{1}{2}A^2 + \frac{1}{3}A^3 - \frac{1}{4}A^4 + \frac{1}{5}A^5$ &c; and which therefore may be conſidered as Mercator's quadrature of the hyperbola, or his general expreſſion of an hyperbolic logarithm in an infinite ſeries. And this method was farther improved by Dr. Wallis in the Philoſ. Tranſ. for the year 1668.

In *prop.* 18 our author compares the hyperbolic *areolæ* with the *ratiunculæ* of equidifferent numbers, and obſerves that
the areola BIps is the meaſure of the ratiuncula of AI to Ap,
the areola spqt is the meaſure of the ratiuncula of AI to Aq,
the areola tqru is the meaſure of the ratiuncula of Aq to Ar, &c.

Finally, in the 19th *prop.* he ſhews how the ſums of logarithms may be taken after the manner of the ſums of the *areolæ*. And from hence infers as a corollary, how the continual product of any given numbers in arithmetical progreſſion may be obtained: for the ſum of the logarithms is the logarithm of the continual product. He then remarks that from the premiſes it appears in what manner Merſennus's problem may be reſolved, if not geometrically, at leaſt in figures to any number of places. And thus cloſes this ingenious tract.

In the Philoſ. Tranſ. for 1668 are alſo given ſome farther illuſtrations of this work by the author himſelf. And in various places alſo in a ſimilar manner are logarithms and hyperbolic areas treated of by Lord Brouncker, Dr. Wallis, Sir I. Newton, and many other learned perſons.

Of Gregory's Exercitationes Geometricæ.

In the ſame year 1668 came out Mr. James Gregory's *Exercitationes Geometricæ*, in which are contained

1, Appendicula ad veram circuli et hyperbolæ quadraturam:

2, N. Mercatoris quadratura hyperbolæ geometricè demonſtrata:

3, Analogia inter lineam meridianam planiſphærii nautici et tangentes artificiales geometricè demonſtrata; ſeu quod ſecantium naturalium additio efficiat tangentes artificiales:

4, Item, quot tangentium naturalium additio efficiat ſecantes artificiales:

5, Quadratura conchoidis:

6, Quadratura ciſſoidis: &

7. Metho-

7, Methodus facilis et accurata componendi ſecantes et tangentes artificiales.

The firſt of theſe pieces, or the *Appendicula*, contains ſome farther extenſion and illuſtration of his *Vera circuli et hyperbolæ quadratura*, occaſioned by the animadverſions made on that work by the famous mathematician and philoſopher Huygens.

In the 2d is demonſtrated geometrically the quadrature of the hyperbola, by which he finds a ſeries ſimilar to Mercator's for the logarithm, or the hyperbolic ſpace beyond the firſt ordinate (BI, *fig. pa.* 92.) In like manner he finds another ſeries for the ſpace at an equal diſtance within that ordinate. Theſe two ſeries having all their terms alike, but all the ſigns of the one plus, and thoſe of the other alternately plus and minus, by adding the two together, every other term is cancelled, and the double of the reſt denotes the ſum of both ſpaces. He then applies theſe properties to the logarithms; the concluſion from all which may be thus briefly expreſſed:

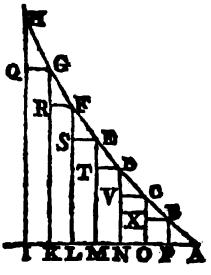
ſince $A-\frac{1}{2}A^2+\frac{1}{3}A^3-\frac{1}{4}A^4$ &c. = the log. of $\frac{1+A}{1}$,

and $A+\frac{1}{2}A^2+\frac{1}{3}A^3+\frac{1}{4}A^4$ &c. = the log. of $\frac{1}{1-A}$,

therefore $2A+\frac{2}{3}A^3+\frac{2}{5}A^5+\frac{2}{7}A^7$ &c. = the log. of $\frac{1+A}{1-A}$, or of the ratio of $1-A$ to $1+A$. Which may be accounted Mr. James Gregory's method of making logarithms.

The remainder of this little volume is chiefly employed about the nautical meridian, and the logarithmic tangents and ſecants. It does not appear by whom, nor by what accident, was diſcovered the analogy between a ſcale of logarithmic tangents and Wright's protraction of the nautical meridian line, which conſiſted of the ſums of the ſecants. It appears however to have been firſt publiſhed, and introduced into the practice of navigation, by Mr. Henry Bond, who mentions this property in an edition of Norwood's Epitome of Navigation, printed about 1645; and he again treats of it more fully in an edition of Gunter's works printed in 1653, where he teaches, from this property, to reſolve all the caſes of Mercator's ſailing by the logarithmic tangents, independent of the table of meridional parts. This analogy had only been found to be nearly true by trials, but not demonſtrated to be a mathematical property. Such demonſtration ſeems to have been firſt diſcovered by Mr. Nicholas Mercator, who, deſirous of making the moſt advantage of this and another concealed invention of his in navigation, by a paper in the Philoſ. Tranſ. for June 4, 1666, invites the public to enter into a wager with him on his ability to prove the truth or falſehood of the ſuppoſed analogy. This mercenary propoſal however ſeems not to have been taken up by any one, and Mercator reſerved his demonſtration. The propoſal however excited the attention of mathematicians to the ſubject itſelf, and a demonſtration was not long wanting. The firſt was publiſhed about two years after by Gregory in the tract now under conſideration, and from thence and other

other ſimilar properties here demonſtrated, he ſhews in the laſt article how the tables of logarithmic tangents and ſecants may eaſily be computed from the natural tangents and ſecants. The ſubſtance of which is as follows:



Let AI be the arc of a quadrant extended in a right line, and let the figure AHI be compoſed of the natural tangents of every arc from the point A erected perpendicular to AI at their reſpective points: let AP, PO, ON, NM, &c, be the very ſmall equal parts into which the quadrant is divided, namely, each $\frac{1}{500}$, or $\frac{1}{100}$ of a degree, draw PB, OC, ND, ME, &c perpendicular to AI. Then it is manifeſt from what had been monſtrated, that the figures ABP, ACO, &c are the artificial ſecants of the arcs AP, AO, &c, putting o for the artificial radius. It is alſo manifeſt that the rectangles BO, CN, DM, &c will be found from the multiplication of the ſmall part AP of the quadrant by each natural tangent. But, he proceeds, there is a little more difficulty in meaſuring the figures ABP, BCX, CDV, &c; for if the firſt differences of the tangents be equal, AB, BC, CD, &c will not differ from right lines, and then the figures ABP, BCX, CDV, &c will be right-angled triangles, and therefore any one, as HQG, will be $= \frac{1}{2}QH \times QG$: but if the ſecond differences be equal, the ſaid figures will be portions of trilineal quadratices, for example HQG will be a portion of a trilineal quadratrix, whoſe axis is parallel to QH; and each of the laſt differences being Z, it will be $QHG = \frac{1}{2}QH \times QG - \frac{1}{12}Z \times QG$: and if the 3d differences be equal, the ſaid figures will be portions of trilineal cubices, and then ſhall QHG be equal $\frac{1}{2}QH \times QG - \sqrt{\frac{1}{72}QH \times Z \times QG^2 - \frac{1}{1728}Z^2 \times QG^2}$: when the 4th differences are equal, the ſaid figures are portions of trilineal quadrato-quadratices, and the 4th differences are equal to 24 times the 4th power of QG divided by the cube of the latus rectum; alſo when the 5th differences are equal, the ſaid figures are portions of trilineal ſurſolids, and the 5th differences are equal to 120 times the ſurſolid of QG divided by the 4th power of the latus rectum; and ſo on *in infinitum*. What has been here ſaid of the compoſition of artificial ſecants from the natural tangents, it is remarked, may in like manner be underſtood of the compoſition of artificial tangents from the natural ſecants, according to what was before demonſtrated. It is alſo obſerved that the artificial tangents and ſecants are computed, as above, on the ſuppoſition that o is the logarithm of 1, and 1000000000000 the radius, and 23025850929940456240178 70 the logarithm of 10; but that they may be more eaſily computed, namely by addition only, by putting $\frac{1}{60}$ of a degree $\doteq$ QG $=$ AP $= 1$, and the logarithm of 10 $=$ 791570 4467897819; for by this means $\frac{1}{2}QH \times QG$ is $= \frac{1}{2}QH = QHG$, and $\frac{1}{2}QH \times QG - \frac{1}{12}Z \times QG = \frac{1}{2}QH - \frac{1}{12}Z\frac{1}{2} = QHG$,

alſo

alſo $\frac{1}{2}QH \times QG - \sqrt{\frac{1}{72}QH \times Z \times QG^2 - \frac{1}{1728}Z^2 \times QG^2} = \frac{1}{2}QH - \sqrt{\frac{1}{72}QH \times Z - \frac{1}{1728}Z^2} = QHG$: And finally by one diviſion only are found the artificial tangents and ſecants to 10000000000000000 the logarithm of 10, putting ſtill 1 for radius, which are the differences of the artificial tangents and ſecants in the table from that artificial radius; and to make the operations eaſier in multiplying by the number 79157044678978 19, or logarithm of 10, a table is ſet down of its products by the firſt 9 figures. But if AP or QG be $= \frac{1}{100}$ of a degree, the artificial tangents and ſecants will anſwer to 13192840779829703 as the logarithm of 10, whoſe firſt 9 multiples are alſo placed in the table. But to repreſent the numbers by the artificial radius rather than by the logarithm of 10, the author directs to add ciphers, &c.—And ſo much for Gregory's *Exercitationes Geometricæ*.

The ſame analogy between the logarithmic tangents and the meridian line, as alſo other ſimilar properties, were afterwards more elegantly demonſtrated by Dr. Halley in the Philoſ. Tranſ. for Feb. 1696, and various methods given for computing the ſame, by examining the nature of the ſpirals into which the rhumbs are tranſformed in the ſtereographical projection of the ſphere on the plane of the equator: the doctrine of which was rendered ſtill more eaſy and elegant by the ingenious Mr. Cotes in his *Logometria*, firſt printed in the Philoſ. Tranſ. for 1714, and afterwards in the collection of his works publiſhed in 1732 by his couſin Dr Robert Smith, who ſucceeded him in the Plumian profeſſorſhip of philoſophy in the Univerſity of Cambridge.

The learned Dr Iſaac Barrow alſo, in his *Lectiones Geometricæ, Lect.* XI. *Append.* firſt publiſhed in 1672, delivers a ſimilar property, namely, that the ſum of all the ſecants of any arc, is analogous to the logarithm of the ratio of $r+s$ to $r-s$, or radius plus ſine to radius minus ſine; or, which is the ſame thing, that the meridional parts anſwering to any degree of latitude, are as the logarithms of the ratios of the verſed ſines of the diſtances from the two poles.

Mr. Gregory's method for making logarithms was farther exemplified in numbers, in a ſmall tract on this ſubject, printed in 1688, by one Euclid Speidell, a ſimple and illiterate perſon, and ſon of John Speidell before mentioned among the firſt writers on logarithms.

Mr. Gregory alſo invented many other infinite ſeries, and among them theſe here following, viz. a being an arc, t its tangent, and s the ſecant, to the radius r; then is

$$a = t - \frac{t^3}{3r^2} + \frac{t^5}{5r^4} - \frac{t^7}{7r^6} + \frac{t^9}{9r^8} \text{ \&c.}$$

$$t = a + \frac{a^3}{3r^2} + \frac{2a^5}{15r^4} + \frac{17a^7}{315r^6} + \frac{62a^9}{2835r^8} \text{ \&c.}$$

$$s = r + \frac{a^2}{2r} + \frac{5a^4}{24r^3} + \frac{61a^6}{720r^5} + \frac{277a^8}{8064r^7} \text{ \&c.}$$

And if τ and σ be the artificial or logarithmic tangent and ſecant of the ſame arc a, the whole quadrant being q, and $e = 2a - q$; then

$$s = \tau - \frac{\tau^3}{6r^2} + \frac{\tau^5}{24r^4} - \frac{61\tau^7}{5040r^6} + \frac{277\tau^9}{72576r^8} \text{ \&c.}$$

$$\tau = e + \frac{e^3}{6r^2} + \frac{e^5}{24r^4} + \frac{61e^7}{5040r^6} + \frac{277e^9}{72576r^8} \text{ \&c.}$$

$$\sigma = \frac{a^2}{2r} + \frac{a^4}{12r^3} + \frac{a^6}{45r^5} + \frac{17a^8}{2520r^7} + \frac{62a^{10}}{28350r^9} \text{ \&c.}$$

Alſo if f be the artificial ſecant of 45°, and $f + l$ the artificial ſecant of any arc a, the artificial radius being 0; then is

$$a = \tfrac{1}{2}q + l - \frac{l^2}{r} + \frac{4l^3}{3r^2} - \frac{7l^4}{3r^3} + \frac{14l^5}{3r^4} - \frac{452l^6}{45r^5} \text{ \&c.}$$

The inveſtigation of all which ſeries may be ſeen at pa. 298 *et ſeq.* vol. 1. Dr Horſley's learned and elegant commentary on Sir I. Newton's works, as they were given in the *Commercium Epiſtolicum* No xx without demonſtration, and where the number 2 is alſo wanting in the denominator of the firſt term of the ſeries expreſſing the value of σ.

Such then were the ways in which Mercator and Gregory applied theſe their very ſimple ſeries $A - \frac{1}{2}A^2 + \frac{1}{3}A^3 - \frac{1}{4}A^4$ &c, and $A + \frac{1}{2}A^2 + \frac{1}{3}A^3 + \frac{1}{4}A^4$ &c, for the purpoſe of computing logarithms. But they might, as I apprehend, have applied them to this purpoſe in a ſhorter and more direct manner, by computing, by their means, only a few logarithms of ſmall ratios, in which the terms of the ſeries would have decreaſed by the powers of 10 or ſome greater number, the numerators of all the terms being unity, and their denominators the powers of 10 or ſome greater number, and then employing theſe few logarithms, ſo computed, to the finding of the logarithms of other and greater ratios by the eaſy operations of mere addition and ſubtraction. This might have been done for the logarithms of the ratios of the firſt ten numbers, 2, 3, 4, 5, 6, 7, 8, 9, 10, and 11, to 1, in the following manner, communicated by Mr Baron Maſeres.——In the firſt place the logarithm of the ratio of 10 to 9, or of 1 to $\frac{9}{10}$, or of 1 to $1 - \frac{1}{10}$, is equal to the ſeries $\frac{1}{10} + \frac{1}{2 \times 100} + \frac{1}{3 \times 1000} + \frac{1}{4 \times 10000} + \frac{1}{5 \times 100000}$ &c. In like manner are eaſily found the logarithms of the ratios of 11 to 10; and then by the ſame ſeries thoſe of 121 to 120, and of 81 to 80, and of 2401 to 2400; in all which caſes the ſeries would converge ſtill faſter than in the two firſt caſes. We may then proceed by mere addition and ſubtraction of logarithms, as follows.

Log. $\frac{11}{9} = \text{L.} \frac{11}{10} + \text{L.} \frac{10}{9}$,	L. $\frac{100}{99} = \text{L.} \frac{1}{2}$,	L. $\frac{80}{81} = \text{L.} \frac{81}{100} - \text{L.} \frac{81}{80}$
L. $\frac{121}{81} = 2\,\text{L.} \frac{11}{9}$,	L. $\frac{9}{4} = 2\,\text{L.} \frac{1}{2}$,	L. $\frac{8}{7} = \text{L.} \frac{80}{100}$,
L. $\frac{121}{80} = \text{L.} \frac{121}{81} + \text{L.} \frac{81}{80}$,	L. $\frac{10}{4} = \text{L.} \frac{10}{9} + \text{L.} \frac{9}{4}$,	L. $\frac{7}{2} = \text{L.} \frac{14}{4}$,
L. $\frac{120}{80} = \text{L.} \frac{121}{80} - \text{L.} \frac{121}{120}$,	L. $\frac{81}{16} = 2\,\text{L.} \frac{9}{4}$,	L. $\frac{7}{1} = \text{L.} \frac{7}{2} - \text{L.} \frac{2}{1}$.

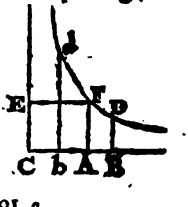
Having thus got the logarithm of the ratio of 2 to 1, or, in common language, the logarithm of 2, the logarithms of all ſorts of even numbers may be derived from thoſe of the odd numbers which are their coefficients with 2 or its powers. I would then proceed as follows.

L. 4 = 2 L. 2,	L. 100 = 2 L. 10,	L. 2401 = L. $\frac{2401}{2400}$ + L. 2400,
L. 10 = L. $\frac{10}{4}$ + L. 4,	L. 8 = 3 L. 2,	L. 7 = $\frac{1}{4}$ L. 2401,
L. 9 = L. $\frac{9}{8}$ + L. 4,	L. 24 = L. 8 + L. 3,	L. 11 = L. $\frac{11}{9}$ + L. 9,
L. 3 = $\frac{1}{2}$ L. 9	L. 2400 = L. 100 + L. 24.	L. 6 = L. 2 + L. 3.

Thus we have got the logarithms of 2, 3, 4, 5, 6, 7, 8, 9, 10, and 11. And this is upon the whole, perhaps the beſt method of computing logarithms that can be taken. There have been indeed ſome methods diſcovered by Dr. Halley, and other mathematicians, for computing the logarithms of the ratios of prime numbers to the next adjacent even numbers, that are ſtill ſhorter than the application of the foregoing ſerics. But thoſe methods are leſs ſimple and eaſy to underſtand and apply than theſe ſeries; and the computation of logarithms by theſe ſeries, when the terms of them decreaſe by the powers of 10, or of ſome greater number, is ſo very ſhort and eaſy (as we have ſeen in the foregoing computations of the logarithms of the ratios of 10 to 9, 11 to 10, 81 to 80, 121 to 120, &c,) that it is not worth while to ſeek for any ſhorter methods of computing them. And this method of computing logarithms is very nearly the ſame with that of Sir Iſaac Newton in his ſecond letter to Mr. Oldenburg, dated October 1676, as will be ſeen in the following article.

Of Sir Iſaac Newton's Methods.

The excellent Sir I. Newton greatly improved the quadrature of the hyperbolical-aſymptotic ſpaces by infinite ſeries, derived from the general quadrature of curves by his method of fluxions; or rather indeed he invented that method himſelf, and the conſtruction of logarithms derived from it, in the year 1665 or 1666, before the publication of either Mercator's or Gregory's books, as appears by his letter to Mr. Oldenburg dated Oct. 24, 1676, printed in pa. 634 *et ſeq.* vol. 3 of Wallis's works, and elſewhere. The quadrature of the hyperbola, thence tranſlated is to this effect. Let dFD be an hyperbola, whoſe center is C, vertex F, and interpoſed ſquare CAFE = 1. In CA take AB and Ab on each ſide = $\frac{1}{10}$ or 0·1: And, erecting the perpendiculars BD, bd; half the ſum of the ſpaces AD and Ad will be



$$= 0.1 + \frac{0.001}{3} + \frac{0.00001}{5} + \frac{0.0000001}{7} \text{ &c.}$$

and the half diff. $= \frac{0.01}{2} + \frac{0.0001}{4} + \frac{0.000001}{6} + \frac{0.00000001}{8}$ &c. Which reduced will ſtand thus,

1.000000000000	0.005000000000	The ſum of theſe 0.105360515657 is Ad.
3333333333	250000000	and the differ. 0.095310179804 3 is AD.
20000000	1666666	In like manner putting AB and Ab
142857	12500	each = 0.2, there is obtained
1111	100	Ad = 0.223143551314 2, and
9	1	AD = 0.182321556793 9.
0.100335347731 0	0.005025167926 7	

Having thus the hyperbolic logarithms of the four decimal numbers 0.8, 0.9, 1.1, and 1.2; and ſince $\frac{1.2}{0.8} \times \frac{1.2}{0.9} = 2$, and 0.8 and 0.9 are leſs than unity; add their logarithms to double the logarithm of 1.2, and you will have 0.693147180559 7 the hyperbolic logarithm of 2. To the triple of this add the logarithm of 0.8, becauſe $\frac{2 \times 2 \times 2}{0.8} =$ 10, and you have 2.302585092993 3 the logarithm of 10. Hence by one addition are found the logarithms of 9 and 11: And thus the logarithms of all theſe prime numbers 2, 3, 5, 11 are prepared. Moreover, by only depreſſing the numbers, above computed, lower in the decimal places, and adding, are obtained the logarithms of the decimals 0.98, 0.99, 1.01, 1.02; as alſo of theſe 0.998, 0.999, 1.001, 1.002: And hence by addition and ſubtraction will ariſe the logarithms of the primes 7, 13, 17, 37, &c. All which logarithms being divided by the above logarithm of 10, give the common logarithms to be inſerted in the table.

And again a few pages farther on in the ſame letter he reſumes the conſtruction of the logarithms, thus: Having found, as above, the hyperbolic logarithms of 10, 0.98, 0.99, 1.01, 1.02, which may be effected in an hour or two, divide the laſt four logarithms by the logarithm of 10, and adding the index 2, you will have the tabular logarithms of 98, 99, 100, 101, 102. Then by interpolating nine means between each of theſe, will be obtained the logarithms of all numbers between 980 and 1020; and again interpolating 9 means between every two numbers from 980 to 1000, the table will be ſo far conſtructed. Then from theſe will be collected the logarithms of all the primes under 100, together with thoſe of their multiples: all which will require only addition and ſubtraction; for

$$\sqrt[10]{\frac{9984 \times 1020}{9945}} = 2, \frac{10}{2} = 5, \sqrt{\frac{98}{2}} = 7, \frac{99}{9} = 11, \frac{1001}{7 \times 11} = 13, \frac{102}{6} = 17,$$

$$\frac{988}{4 \times 13} = 19, \frac{9936}{16 \times 27} = 23, \frac{986}{2 \times 17} = 29, \frac{992}{32} = 31, \frac{999}{27} = 37, \frac{984}{24} = 41,$$

$$\frac{989}{23} = 43, \frac{987}{27} = 47, \frac{9911}{11 \times 17} = 53, \frac{9971}{13 \times 13} = 59, \frac{9882}{2 \times 81} = 61, \frac{9849}{3 \times 49} = 67,$$

$$\frac{994}{14} = 71, \frac{9928}{8 \times 17} = 73, \frac{9954}{7 \times 18} = 79, \frac{996}{12} = 83, \frac{9968}{7 \times 16} = 89, \frac{9894}{6 \times 17} = 97.$$

This quadrature of the hyperbola, and its application to the conſtruction of logarithms, are ſtill farther explained by our celebrated author in his treatiſe on Fluxions, publiſhed by Mr Colſon in 1736, where he gives all the three ſeries for the areas AD, Ad, Bd, in general terms, the former the ſame as that publiſhed by Mercator, and the latter by Gregory; and he explains the manner of deriving the latter ſeries from the former, namely by uniting together the two ſeries for the ſpaces on each ſide of an ordinate, bounded by other ordinates at equal diſtances, every 2d term of each ſeries is cancelled,

cancelled, and the result is a series converging much quicker than either of the former. And, in this treatise on fluxions, as well as in the letter before quoted, he recommends this as the most commodious method of constructing a canon of logarithms, computing by the series the hyperbolic spaces answering to the prime numbers 2, 3, 5, 7, 11, &c, and dividing them by 2.3025850929940457, which is the area corresponding to the number 10, or else multiplying them by its reciprocal 0.4342944819032518, for the common logarithms. "Then the logarithms of all the numbers in the canon which are made by the multiplication of these, are to be found by the addition of their logarithms, as is usual. And the void places are to be interpolated afterwards by the help of this theorem: Let n be a number to which a logarithm is to be adapted, x the difference between that and the two nearest numbers equally distant on each side, whose logarithms are already found, and let d be half the difference of the logarithms; then the required logarithm of the number n will be obtained by adding $d + \frac{dx}{2n} + \frac{dx^3}{12n^3}$ &c to the logarithm of the less number." This theorem he demonstrates by the hyperbolic areas, and then proceeds thus; "The two first terms $d + \frac{dx}{2n}$ of this series I think to be accurate enough for the construction of a canon of logarithms, even though they were to be produced to 14 or 15 figures; provided the number whose logarithm is to be found be not less than 1000. And this can give little trouble in the calculation, because x is generally an unit, or the number 2. Yet it is not necessary to interpolate all the places by the help of this rule. For the logarithms of numbers which are produced by the multiplication or division of the number last found, may be obtained by the numbers whose logarithms were had before, by the addition or subtraction of their logarithms. Moreover by the differences of the logarithms, and by their 2d and 3d differences, if there be occasion, the void places may be more expeditiously supplied; the foregoing rule being to be applied only when the continuation of some full places is wanted, in order to obtain those differences, &c." So that Sir I. Newton of himself discovered all the series for the above quadrature which were found out, and afterwards published, partly by Mercator and partly by Gregory; and these we may here exhibit in one view all together, and that in a general manner for any hyperbola, namely putting CA $= a$, AF $= b$, and AB $=$ Ab $= x$; then will

BD $= \frac{ab}{a+x}$, and bd $= \frac{ab}{a-x}$; whence the area

$$\text{AD} = bx - \frac{bx^2}{2a} + \frac{bx^3}{3a^2} - \frac{bx^4}{4a^3} + \frac{bx^5}{5a^4} \text{ &c.}$$

$$\text{Ad} = bx + \frac{bx^2}{2a} + \frac{bx^3}{3a^2} + \frac{bx^4}{4a^3} + \frac{bx^5}{5a^4} \text{ &c.}$$

$$\text{Bd} = 2bx + \frac{2bx^3}{3a^2} + \frac{2bx^5}{5a^4} + \frac{2bx^7}{7a^6} + \frac{2bx^9}{9a^8} \text{ &c.}$$

In

hyperbola, with a ſpeedy method for finding the number from the given logarithm."

Inſtead of the more ordinary definition of logarithms, *numerorum proportionalium æquidifferentes comites*, in this tract our learned author adopts this other, *numeri rationum exponentes*, as being better adapted to the principle on which logarithms are here conſtructed, where thoſe quantities are not conſidered as the logarithms of the numbers, for example, of 2, or of 3, or of 10, but as the logarithms of the ratios of 1 to 2, or 1 to 3, or 1 to 10. In this conſideration he firſt purſues the idea of Kepler and Mercator, remarking that any ſuch ratio is proportional to, and is meaſured by, the number of equal ratiunculæ contained in each; which ratiunculæ are to be underſtood as in a continued ſcale of proportionals, infinite in number, between the two terms of the ratio; which infinite number of mean proportionals is to that infinite number of the like and equal ratiunculæ between any other two terms, as the logarithm of the one ratio is to the logarithm of the other: thus, if there be ſuppoſed between 1 and 10 an infinite ſcale of mean proportionals, whoſe number is 100000 &c *in infinitum*; then between 1 and 2 there will be 30102 &c of ſuch proportionals; and between 1 and 3 there will be 47712 &c of them; which numbers therefore are the logarithms of the ratios of 1 to 10, 1 to 2, and 1 to 3. But for the ſake of *his* mode of conſtructing logarithms, he changes this idea of *equal* ratiunculæ for that of other ratiunculæ, ſo conſtituted as that the *ſame* infinite number of them ſhall be contained in the ratio of 1 to every other number whatever; and that therefore theſe latter ratiunculæ will be of *unequal* or different magnitudes in all the different ratios, and in ſuch ſort that, in any one ratio, the *magnitude* of each of the ratiunculæ in this latter caſe, will be as the *number* of them in the former. And therefore if between 1 and any number propoſed, there be taken any infinity of mean proportionals, the infinitely ſmall augment or decrement of the firſt of thoſe means from the firſt term 1, will be a ratiuncula of the ratio of 1 to the ſaid number; and as the number of all the ratiunculæ in theſe continued proportionals is the ſame, their ſum or the whole ratio will be directly proportional to the magnitude of one of the ſaid ratiunculæ in each ratio. But it is alſo evident that the firſt of any number of means between 1 and any number, is always equal to ſuch root of that number whoſe index is expreſſed by the number of thoſe proportionals from 1; ſo if m denote the number of proportionals from 1, then the firſt term after 1 will be the mth root of that number. Hence the indefinite root of any number being extracted, the *differentiola* of the ſaid root from unity, ſhall be as the logarithm of that number. So if there be required the logarithm of the ratio of 1 to $1+q$; the firſt term after 1 will be $\overline{1+q}^{\frac{1}{m}}$, and therefore the required logarithm will be as $\overline{1+q}^{\frac{1}{m}}-1$. But, by the binomial theorem, $\overline{1+q}^{\frac{1}{m}}$ is $= 1+\frac{1}{m}q+\frac{1}{m}\cdot\frac{1-m}{2m}q^2+\frac{1}{m}\cdot\frac{1-m}{2m}\cdot\frac{1-2m}{3m}q^3$ &c; or by omitting the 1 in the compound numerators, as infinitely

nitely ſmall in reſpect of the infinite number m, the ſame ſeries will become $1 + \frac{1}{m}q + \frac{1}{m}\cdot\frac{-m}{2m}q^2 + \frac{1}{m}\cdot\frac{-m}{2m}\cdot\frac{-2m}{3m}q^3$ &c, or by abbreviation it is $1 + \frac{1}{m}q - \frac{1}{2m}q^2 + \frac{1}{3m}q^3 - \frac{1}{4m}q^4$ &c; and hence finding the differentiola by ſubſtracting 1, the logarithm of the ratio of 1 to $1 + q$ will be as $\frac{1}{m}$ into $q - \frac{1}{2}q^2 + \frac{1}{3}q^3 - \frac{1}{4}q^4 + \frac{1}{5}q^5 - \frac{1}{6}q^6$ &c. Now the index m may be taken equal to any infinite number, and thus all the varieties of ſcales of logarithms may be produced: ſo, if m be taken 1000000 &c, the theorem will give Napier's logarithms; but if m be taken equal to 230258 &c, there will ariſe Briggs's logarithms.

This theorem being for the increaſing ratio of 1 to $1 + q$; if that for the decreaſing ratio of 1 to $1 - q$ be alſo ſought, it will be obtained by a proper change of the ſigns, by which the decrement of the firſt of the infinite number of proportionals will be found to be $\frac{1}{m}$ into $q + \frac{1}{2}q^2 + \frac{1}{3}q^3 + \frac{1}{4}q^4$ &c, which therefore is as the logarithm of the ratio of 1 to $1 - q$.

Hence the terms of any ratio being a and b, q becomes $\frac{b-a}{a}$, or the difference divided by the leſs term, when it is an increaſing ratio; or $q = \frac{b-a}{b}$ when the ratio is decreaſing, or as b to a. Wherefore the logarithm of the ſame ratio may be doubly expreſſed; for putting x for the difference $b - a$ of the terms, it will be

$$\text{either } \frac{1}{m} \text{ into } \frac{x}{a} - \frac{x^2}{2a^2} + \frac{x^3}{3a^3} - \frac{x^4}{4a^4} \text{ &c,}$$

$$\text{or } \frac{1}{m} \text{ into } \frac{x}{b} + \frac{x^2}{2b^2} + \frac{x^3}{3b^3} + \frac{x^4}{4b^4} \text{ &c.}$$

But if the ratio of a to b be ſuppoſed divided into two parts, namely, into the ratio of a to $\frac{1}{2}a + \frac{1}{2}b$ or $\frac{1}{2}z$, and the ratio of $\frac{1}{2}z$ to b, then will the ſum of the logarithms of thoſe two ratios be the logarithm of the ratio of a to b. Now by ſubſtituting in the foregoing ſeries, the logarithms of thoſe two ratios will

be $\frac{1}{m}$ into $\frac{x}{z} + \frac{x^2}{2z^2} + \frac{x^3}{3z^3} + \frac{x^4}{4z^4} + \frac{x^5}{5z^5}$ &c,

and $\frac{1}{m}$ into $\frac{x}{z} - \frac{x^2}{2z^2} + \frac{x^3}{3z^3} - \frac{x^4}{4z^4} + \frac{x^5}{5z^5}$ &c; and ſo the ſum

$\frac{1}{m}$ into $\frac{2x}{z} + \frac{2x^3}{3z^3} + \frac{2x^5}{5z^5} + \frac{2x^7}{7z^7}$ &c will be the log. of the ratio of a to b.

Moreover, if from the logarithm of the ratio of a to $\frac{1}{2}z$ be taken that of $\frac{1}{2}z$ to b, we ſhall have the logarithm of the ratio of ab to $\frac{1}{4}z^2$; and the half of this gives that of $\sqrt{ab}$ to $\frac{1}{2}z$, or of the geometrical mean to the arithmetical mean. And conſequently the logarithm of this ratio will be equal to half the difference of that of the above two ratios, and will therefore be $\frac{1}{m}$ into $\frac{x^2}{2z^2} + \frac{x^4}{4z^4} + \frac{x^6}{6z^6} + \frac{x^8}{8z^8}$ &c.

The above ſeries are ſimilar to ſome that were before given by Newton and Gregory for the ſame purpoſe, deduced from the conſideration of the hyperbola. But the rule which is properly our au-

thor's own, is that which follows, and is derived from the ſeries above given for the logarithm of the ſum of two ratios. For the ratio of ab to $\frac{1}{4}z^2$ or $\frac{1}{4}a^2 + \frac{1}{2}ab + \frac{1}{4}b^2$, having the difference of its terms $\frac{1}{4}a^2 - \frac{1}{2}ab + \frac{1}{4}b^2$ or $\overline{\frac{1}{2}b - \frac{1}{2}a}^2$ or $\frac{1}{4}x^2$, which in the caſe of finding the logarithms of prime numbers is always 1, if we call the ſum of the terms $\frac{1}{4}z^2 + ab = y^2$, the logarithm of the ratio of $\sqrt{ab}$ to $\frac{1}{2}a + \frac{1}{2}b$ or $\frac{1}{2}z$ will be found to be

$$\frac{1}{m} \text{ into } \frac{1}{y^2} + \frac{1}{3y^6} + \frac{1}{5y^{10}} + \frac{1}{7y^{14}} + \frac{1}{9y^{18}} \text{ &c.}$$

And theſe rules our learned author exemplifies by ſome caſes in numbers, to ſhew the eaſieſt mode of application in practice.

Again by means of the ſame binomial theorem he reſolves with equal facility the reverſe of the problem, namely, from the logarithm given, to find its number or ratio: For as the logarithm of the ratio of 1 to $1 + q$ was proved to be $\overline{1+q}^{\frac{1}{m}} - 1$, and that of the ratio of 1 to $1 - q$ to be . . . $1 - \overline{1-q}^{\frac{1}{m}}$; hence, calling the given logarithm L, in the former caſe

it will be $\overline{1+q}^{\frac{1}{m}} = 1 + L$,

and in the latter $\overline{1-q}^{\frac{1}{m}} = 1 - L$;

and therefore $1 + q = \overline{1+L}^m$, and $1 - q = \overline{1-L}^m$, that is by the binomial theorem

$$1 + q = 1 + mL + \tfrac{1}{2}m^2L^2 + \tfrac{1}{6}m^3L^3 + \tfrac{1}{24}m^4L^4 + \tfrac{1}{120}m^5L^5 \text{ &c,}$$

$$\text{and } 1 - q = 1 - mL + \tfrac{1}{2}m^2L^2 - \tfrac{1}{6}m^3L^3 + \tfrac{1}{24}m^4L^4 - \tfrac{1}{120}m^5L^5 \text{ &c.}$$

m being any infinite index whatever, differing according to the ſcale of logarithms, being 1000 &c in Napier's or the hyperbolic logarithms, and 2302585 &c in Briggs's.

If one term of the ratio, of which L is the logarithm, be given, the other term will be eaſily obtained by the ſame rule: For if L be Napier's logarithm of the ratio of a the leſs term to b the greater, then according as a or b is given we ſhall have

$$b = a \text{ into } 1 + L + \tfrac{1}{2}L^2 + \tfrac{1}{6}L^3 + \tfrac{1}{24}L^4 \text{ &c,}$$

$$a = b \text{ into } 1 - L + \tfrac{1}{2}L^2 - \tfrac{1}{6}L^3 + \tfrac{1}{24}L^4 \text{ &c.}$$

Whence, by the help of the logarithms contained in the tables, may eaſily be found the number to any given logarithm to a great extent: For if the ſmall difference between the given logarithm L and the neareſt tabular logarithm, either greater or leſs, be called l, and the number anſwering to the tabular logarithm a when it is leſs than the given logarithm, but b when greater; it will follow that the number anſwering to the logarithm L will be either

$$a \text{ into } 1 + l + \tfrac{1}{2}l^2 + \tfrac{1}{6}l^3 + \tfrac{1}{24}l^4 + \tfrac{1}{120}l^5 \text{ &c,}$$

$$\text{or } b \text{ into } 1 - l + \tfrac{1}{2}l^2 - \tfrac{1}{6}l^3 + \tfrac{1}{24}l^4 - \tfrac{1}{120}l^5 \text{ &c.}$$

which ſeries converge ſo quick, l being always very ſmall, that the firſt two terms $1 \pm l$ are generally ſufficient to find the number to 10 places of figures.

Dr. Halley ſubjoins alſo an eaſy approximation for theſe ſeries, by which it appears that the number anſwering to the log. is nearly

$\frac{1+\frac{1}{2}l}{1-\frac{1}{2}l} \times a$ or $\frac{1-\frac{1}{2}l}{1+\frac{1}{2}l} \times b$ $\left\{\begin{matrix}\text{in Napier's}\\ \text{logs, and}\end{matrix}\right\}$ $\frac{n+\frac{1}{2}l}{n-\frac{1}{2}l} \times a$ or $\frac{n-\frac{1}{2}l}{n+\frac{1}{2}l} \times b$ $\left\{\text{in Briggs's logarithms;}\right.$
where n is $= 43429448\,1903$ &c $= \frac{1}{m}$.

Of Mr. Sharp's Methods.

The labours of Mr. Abraham Sharp, of Little-Horton near Bradford in Yorkſhire, in this branch of mathematics, were very great and meritorious. His merit however conſiſted rather in the improvement and illuſtration of the methods of former writers, than in the invention of any new ones of his own. In this way he greatly extended and improved Dr. Halley's method above deſcribed, as alſo thoſe of Mercator and Wallis; illuſtrating theſe improvements by extenſive calculations, and by them computing our table 5, conſiſting of the logarithms of all numbers to 100, and of all prime numbers to 1100, each to 61 places. He alſo compoſed a neat compendium of the beſt methods for computing the natural ſines, tangents, and ſecants, chiefly from the rules before given by Newton: and by Newton's or Gregory's ſeries $a = t - \frac{1}{3}t^3 + \frac{1}{5}t^5 - \frac{1}{7}t^7$ &c, for the arc in terms of the tangent, he computed the circumference of the circle to 72 places, namely from the arc of 30 degrees, whoſe tangent t is $= \sqrt{\frac{1}{3}}$ to the radius 1. Other aſtoniſhing inſtances of his induſtry and labour appear in his *Geometry Improv'd*, printed in 1717, and ſigned *A. S. Philomath*, from whence the ſaid table of logarithms was extracted. This ingenious man was ſometime aſſiſtant at the Royal Obſervatory to Mr. Flamſteed the firſt Aſtronomer Royal; and, being one of the moſt accurate and indefatigable computers that ever exiſted, he was for many years the common reſource for Mr. Flamſteed, Sir Jonas Moore, Dr. Halley, &c, in all intricate and troubleſome calculations. He afterwards retired to his native place at Little-Horton, where, after a life ſpent in intenſe ſtudy and calculations, he died the 18th of July 1742, in the 91ſt year of his age.

Of the Conſtruction of Logarithms by Fluxions.

It appears by the very definition and deſcription given by Napier of his logarithms, as ſtated in page 42 of this introduction, that the fluxion of his, or the hyperbolic logarithm, of any number, is a fourth proportional to that number, its logarithm, and unity; or, which is the ſame, that it is equal to the fluxion of the number divided by the number: For the deſcription ſhews that $z1 : za$ or $1 : : \dot{z}1$ the fluxion of $z1 : \dot{z}a$, which therefore is $= \frac{\dot{z}1}{z1}$; but $\dot{z}a$ is alſo equal to the fluxion of the logarithm A &c by the deſcription; therefore the fluxion of the logarithm is equal to $\frac{\dot{z}1}{z1}$, the fluxion of the quantity divided by the quantity itſelf. The ſame thing appears again at art. 2 of that little piece in the appendix to his *Conſtructio Logarithmorum*, entituled *Habitudines Logarithmorum & ſuorum naturalium numerorum*

mererum invicem, where he obſerves that, as any greater quantity is to a leſs, ſo is the velocity of the increment or decrement of the logarithms at the place of the leſs quantity, to that at the greater. Now this velocity of the increment or decrement of the logarithms being the ſame thing as their fluxions, that proportion is this $x : a ::$ flux. log. a : flux. log. x; hence if a be $= 1$, as at the beginning of the table of numbers, where the fluxion of the logs. is the index or characteriſtic c, which is alſo 1 in Napier's or the hyperbolic logarithms, and 43429 &c in Briggs's, the ſame proportion becomes $x : 1 :: c :$ flux. log. x; but the conſtant fluxion of the numbers is alſo 1, and therefore that proportion is alſo this $x : \dot{x} :: c : \frac{c\dot{x}}{x} =$ the fluxion of the logarithm of x; and in the hyperbolic logarithms, where c is $= 1$, it becomes $\frac{\dot{x}}{x} =$ the fluxion of Napier's or the hyperbolic logarithm of x. This ſame property has alſo been noticed by many other authors ſince Napier's time. And the ſame or a ſimilar property is evidently true in all the ſyſtems of logarithms whatever, namely that the modulus of the ſyſtem is to any number, as the fluxion of its logarithm is to the fluxion of the number.

Now from this property, by means of the doctrine of fluxions, are derived other ways for making logarithms, which have been illuſtrated by many writers on this branch, as Craig, Jo. Bernoulli, and almoſt all the writers on fluxions. And this method chiefly conſiſts in expanding the reciprocal of the given quantity in an infinite ſeries, then multiplying each term by the fluxion of the ſaid quantity, and laſtly taking the fluents of the terms; by which there ariſes an infinite ſeries of terms for the logarithm ſought. So, to find the logarithm of any number N; put any compound quantity for N, as ſuppoſe $\frac{n+x}{n}$;

then the flux. of the log. or $\frac{\dot{N}}{N}$ being $\frac{\dot{x}}{n+x} = \frac{\dot{x}}{n} - \frac{x\dot{x}}{nn} + \frac{x^2\dot{x}}{n^3} - \frac{x^3\dot{x}}{n^4}$ &c,

the fluents give log. of N or log. of $\frac{n+x}{n} = \frac{x}{n} - \frac{x^2}{2n^2} + \frac{x^3}{3n^3} - \frac{x^4}{4n^4}$ &c.

And writing $-x$ for x gives log. $\frac{n-x}{n} = -\frac{x}{n} - \frac{x^2}{2n^2} - \frac{x^3}{3n^3} - \frac{x^4}{4n^4}$ &c.

Alſo becauſe $\frac{n}{n \pm x} = 1 \div \frac{n \pm x}{n}$, or log. $\frac{n}{n \pm x} = 0 -$ log. $\frac{n \pm x}{n}$,

we have log. $\frac{n}{n+x} = -\frac{x}{n} + \frac{x^2}{2n^2} - \frac{x^3}{3n^3} + \frac{x^4}{4n^4}$ &c,

and log. $\frac{n}{n-x} = +\frac{x}{n} + \frac{x^2}{2n^2} + \frac{x^3}{3n^3} + \frac{x^4}{4n^4}$ &c.

And by adding and ſubtracting any of theſe ſeries to or from one another, and multiplying or dividing their correſponding numbers, various other ſeries for logarithms may be found, converging much quicker than theſe do.

In

In like manner by aſſuming quantities otherwiſe compounded for the value of N, various other forms of logarithmic ſeries may be found by the ſame means.

Of Mr. Cotes's Logometria.

Mr. Roger Cotes was elected the firſt Plumian profeſſor of aſtronomy and experimental philoſophy in the univerſity of Cambridge, January 1706, which appointment he filled with the greateſt credit, till he died the 5th of June 1716, in the prime of life, having not quite compleated the 34th year of his age. His early death was a great loſs to the mathematical world, as his genius and abilities were of the brighteſt order, as is manifeſt by the ſpecimens of his performance given to the public. Among theſe are his *Logometria*, firſt printed in number 338 of the Philoſophical Tranſactions, and afterwards in his *Harmonia Menſurarum* publiſhed in 1722 with his other works, by his couſin and ſucceſſor, in the Plumian profeſſorſhip, Dr. Robert Smith. In this piece he firſt treats in a general way of meaſures of ratios, which meaſures he obſerves are quantities of any kind whoſe magnitudes are analogous to the magnitudes of the ratios, theſe magnitudes mutually increaſing and decreaſing together in the ſame proportion. He remarks that the ratio of equality has no magnitude, becauſe it produces no change by adding and ſubtracting; that the ratios of greater and leſs inequality, are of different affections; and therefore if the meaſure of the one of theſe be conſidered as poſitive, that of the other will be negative; and the meaſure of the ratio of equality nothing: That there are endleſs ſyſtems of theſe which have all their meaſures of the ſame ratios proportional to certain given quantities, called *moduli*, which he defines afterwards, and the ratio of which they are the meaſures, each in its peculiar ſyſtem, is called the modular ratio, *ratio modularis*, which ratio is the ſame in all ſyſtems. He then adverts to logarithms, which he conſiders as the *numerical* meaſures of ratios, and he deſcribes the method of arranging them in tables, with the uſe of them in multiplication and diviſion, raiſing of powers and extracting of roots, by means of the correſponding operations of addition and ſubtraction, multiplication and diviſion.

After this introduction, which is only a ſlight abridgment of the doctrine long before very amply treated of by others, and particularly by Kepler and Mercator, we arrive at the firſt propoſition, which has juſtly been cenſured as obſcure and imperfect, ſeemingly through an affectation of brevity, intricacy, and originality without ſufficient room for a diſplay of this qualification. The reaſoning in this propoſition, ſuch as it is, ſeems to be ſomething between that of Kepler and the principles of fluxions, to which the quantities and expreſſions are nearly allied. However as it is my duty rather to narrate than explain, I ſhall here exhibit it exactly as it ſtands. This propoſition is to determine the meaſure of any ratio, as for inſtance that of AC to AB, and which is effected in this manner: Conceive the

the difference BC to be divided into innumerable very ſmall particles as PQ, and the ratio between AC and AB into as many ſuch very ſmall ratios, as between AQ and AP: then if the magnitude of the ratio between AQ and AP be given, by dividing there will alſo be given, that of PQ to AP; and therefore, this being given, the magnitude of the ratio between AQ and AP may be expounded by the given quantity $\frac{PQ}{AP}$; for, AP remaining conſtant, conceive the particle PQ to be augmented or diminiſhed in any proportion, and in the ſame proportion will the magnitude of the ratio between AQ and AP be augmented or diminiſhed: Alſo, taking any determinate quantity M, the ſame may be expounded by $M \times \frac{PQ}{AP}$; and therefore the quantity $M \times \frac{PQ}{AP}$ will be the meaſure of the ratio between AQ and AP. And this meaſure will have divers magnitudes, and be accomodated to divers ſyſtems, according to the divers magnitudes of the aſſumed quantity M, which therefore is called the *modulus* of the ſyſtem. Now like as the ſum of all the ratios AQ to AP is equal to the propoſed ratio AC to AB, ſo the ſum of all the meaſures $M \times \frac{PQ}{AP}$ (found by the known methods) will be equal to the required meaſure of the ſaid propoſed ratio.

The general ſolution being thus diſpatched, from the general expreſſion he next deduces other forms of the meaſure in ſeveral corollaries and ſcholia: as 1ſt, The terms AP, AQ, approach the nearer to equality as the ſmall difference PQ is leſs; ſo that either $M \times \frac{PQ}{AP}$ or $M \times \frac{PQ}{AQ}$ will be the meaſure of the ratio between AQ and AP to the modulus M. 2d, That hence the modulus M is to the meaſure of the ratio between AQ and AP, as either AP or AQ is to their difference PQ. 3d, The ratio between AC and AB being given, the ſum of all the $\frac{PQ}{AP}$ will be given; and the ſum of all the $M \times \frac{PQ}{AP}$ is as M: therefore the meaſure of any given ratio is as the modulus of the ſyſtem from which it is taken. 4th, Therefore, in every ſyſtem of meaſures, the modulus will always be equal to the meaſure of a certain determinate and immutable ratio; which therefore he calls the modular ratio. 5th, To illuſtrate the ſolution by an example: let z be any determinate and permanent quantity, x a variable or indeterminate quantity, and $\dot{x}$ its fluxion; then to find the meaſure of the ratio between $z + x$ and $z - x$, put this ratio equal to the ratio between y and 1, expounding the number y by AP, its fluxion $\dot{y}$ by PQ, and 1 by AB: then the fluxion of the required meaſure of the ratio between y and 1 is $M \times \frac{\dot{y}}{y}$. Now for y reſtore its val. $\frac{z+x}{z-x}$, and for $\dot{y}$ the flux. of that val. $\frac{2z\dot{x}}{z-x^2}$, ſo ſhall the flux. of

the

the meaſure become $2M \times \frac{z\dot{z}}{z\dot{z} - x\dot{x}}$ or 2 M into $\frac{\dot{x}}{z} + \frac{\dot{x}x^2}{z^3} + \frac{\dot{x}x^4}{z^5}$ &c.

And therefore that meaſure will be 2 M into $\frac{x}{z} + \frac{x^3}{3z^3} + \frac{x^5}{5z^5}$ &c.

In like manner the meaſure of the ratio between $1 + v$ and 1 will be found to be - - - M into $v - \frac{1}{2}v^2 + \frac{1}{3}v^3 - \frac{1}{4}v^4$ &c. And hence, to find the number from the logarithm given, he reverts the ſeries in this manner: if the laſt meaſure be called m, we ſhall have $\frac{m}{M}$ or $Q = v - \frac{1}{2}v^2 + \frac{1}{3}v^3 - \frac{1}{4}v^4 + \frac{1}{5}v^5$ &c,

and therefore $Q^2 = \ldots v^2 - v^3 + \frac{11}{12}v^4 - \frac{5}{6}v^5$ &c,

and $Q^3 = \ldots\ldots v^3 - \frac{3}{2}v^4 + \frac{7}{4}v^5$ &c,

and $Q^4 = \ldots\ldots\ldots v^4 - 2v^5$ &c,

and $Q^5 = \ldots\ldots\ldots\ldots v^5$ &c;

then by adding continually we ſhall have

$$Q + \tfrac{1}{2}Q^2 = v - \tfrac{1}{6}v^3 + \tfrac{5}{24}v^4 - \tfrac{13}{60}v^5 \text{ &c},$$
$$Q + \tfrac{1}{2}Q^2 + \tfrac{1}{6}Q^3 = v - \tfrac{1}{24}v^4 + \tfrac{3}{40}v^5 \text{ &c},$$
$$Q + \tfrac{1}{2}Q^2 + \tfrac{1}{6}Q^3 + \tfrac{1}{24}Q^4 = v - \tfrac{1}{120}v^5 \text{ &c},$$
$$Q + \tfrac{1}{2}Q^2 + \tfrac{1}{6}Q^3 + \tfrac{1}{24}Q^4 + \tfrac{1}{120}Q^5 = v \text{ &c},$$

that is $v = Q + \frac{1}{2}Q^2 + \frac{1}{6}Q^3 + \frac{1}{24}Q^4 + \frac{1}{120}Q^5$ &c. And therefore the required ratio of $1 + v$ to 1 is equal to the ratio of $1 + Q + \frac{1}{2}Q^2$ &c to 1. Put now $m = M$, or $Q = 1$, and the above will become the ratio of $1 + \frac{1}{1} + \frac{1}{2} + \frac{1}{6} + \frac{1}{24} + \frac{1}{120}$ &c to 1 for the conſtant modular ratio. In like manner, if the ratio between 1 and $1 - v$ be propoſed, the meaſure of this ratio will come out M into $v + \frac{1}{2}v^2 + \frac{1}{3}v^3 + \frac{1}{4}v^4$ &c; which being called m, and $\frac{m}{M} = Q$, that ratio will be the ratio of 1 to $1 - Q + \frac{1}{2}Q^2 - \frac{1}{6}Q^3 + \frac{1}{24}Q^4$ &c. And hence, taking $m = M$, or $Q = 1$, the ſaid modular ratio will alſo be the ratio of 1 to $1 - \frac{1}{1} + \frac{1}{2} - \frac{1}{6} + \frac{1}{24} - \frac{1}{120}$ &c. And the former of theſe expreſſions for the modular ratio comes out the ratio of 2,718281828459 &c to 1, and the latter the ratio of 1 to 0,367879441171 &c.

In the 2d prop. our learned author gives directions for conſtructing Briggs's canon of logarithms, namely, firſt by the general ſeries $2M$ into $\frac{x}{z} + \frac{x^3}{3z^3} + \frac{x^5}{5z^5}$ &c finding the logarithms of a few ſuch ratios as that of 126 to 125, 225 to 224, 2401 to 2400, 4375 to 4374, &c, from whence the logarithm of 10 will be found to be 2,302585092994 &c, when M is 1; but ſince Briggs's log. of 10 is 1, therefore as 2,302585 &c is to the modulus 1, ſo is 1 (Briggs's log. of 10) to 0,434294481903 &c, which therefore is the modulus of Briggs's logarithms. Hence he deduces the logarithms of 7, 5, 3, and 2. In like manner are the logarithms of other prime numbers to be found, and from them the logarithms of compoſite numbers by addition and ſubtraction only.

He

He then remarks that the firſt term of the general ſeries 2M into $\frac{x}{z} + \frac{x^3}{3z^3} + \frac{x^5}{5z^5}$ &c will be ſufficient for the logarithms of intermediate numbers between thoſe in the table, or even for numbers beyond the limits of the table. Thus, to find the logarithm anſwering to any intermediate number; let a and e be two numbers, the one the given number, and the other the neareſt tabular number, a being the greater and e the leſs of them; put $z = a + e$ their ſum, $x = a - e$ their difference, $\lambda =$ the logarithm of the ratio of a to e, that is the exceſs of the logarithm of a above that of e: ſo ſhall the ſaid difference of their logarithms be $\lambda = 2M \times \frac{x}{z}$ very nearly.—And if there be required the number anſwering to any given intermediate logarithm, becauſe λ is $= \frac{2Mx}{z} = \frac{2Mx}{2a-x}$ or $\frac{2Mx}{2e+x}$, therefore $x = \frac{\lambda a}{M+\frac{1}{2}\lambda}$ or $\frac{\lambda e}{M-\frac{1}{2}\lambda}$ very nearly.

In the 3d prop. our ingenious author teaches how to convert the canon of logarithms to logarithms of any other ſyſtem, by means of their *moduli*. And in ſeveral more propoſitions he exemplifies the canon of logarithms in the ſolution of various important problems in geometry and phyſics; ſuch as the quadrature of the hyperbola, the deſcription of the logiſtica, the equi-angular ſpiral, the nautical meridian, &c; the deſcent of bodies in reſiſting mediums, the denſity of the atmoſphere at any altitude, &c, &c.

Of Doctor Taylor's Conſtruction of Logarithms.

Dr. Brook Taylor, (a very learned mathematician, ſecretary to the Royal Society, and who died at Somerſet-houſe, Nov. 1731) gave the following method of conſtructing logarithms in number 352 of the Philoſophical Tranſactions. His method is founded on theſe three conſiderations: 1ſt, that the ſum of the logarithms of any two numbers is the logarithm of the product of thoſe numbers; 2d, that the logarithm of 1 is nothing, and conſequently that the nearer any number is to 1, the nearer will its logarithm be to 0; 3d, that the product of two numbers or factors, of which the one is greater and the other leſs than 1, is nearer to 1 than that factor is which is on the ſame ſide of 1 with itſelf; ſo of the two numbers $\frac{3}{4}$ and $\frac{4}{3}$, the product $\frac{8}{9}$ is leſs than 1, but yet nearer to it than $\frac{3}{4}$ is, which is alſo leſs than 1. On theſe principles he founds the preſent approximation, which he explains by the following example. To find the relation between the logarithms of 2 and 10: In order to this he aſſumes two fractions as $\frac{128}{100}$ and $\frac{8}{10}$, or $\frac{2^7}{10^2}$ and $\frac{2^3}{10}$, whoſe numerators are powers of 2, and their denominators powers of 10, the one fraction being greater and the other leſs than unity or 1. Having ſet theſe two down, in the form of decimal fractions; below each other

other in the first column of the following table, and in the second column A and B for their logarithms, expressing by an equation how they are composed of the logarithms of 2 and 10, the numbers in question, those logarithms being denoted thus, $l\,2$ and $l\,10$. Then

1,280000000000	A = . . . =	$7\,l2-$	$2\,l10$	$l2 > 0{,}28$
0,800000000000	B = . . . =	$3\,l2-$	$l10$	$< 0{,}33$
1,024000000000	C = A + B =	$10\,l2-$	$3\,l10$	$> 0{,}300$
0,990352031429	D = B + 9 C =	$93\,l2-$	$28\,l10$	$< 0{,}30107$
1,004336277664	E = C + 2 D =	$169\,l2-$	$59\,l10$	$> 0{,}301020$
0,998959536107	F = D + 2 E =	$485\,l2-$	$146\,l10$	$< 0{,}30103099$
1,000162894165	G = E + 4 F =	$2136\,l2-$	$643\,l10$	$> 0{,}30102996$
0,999936281874	H = F + 6 G =	$13301\,l2-$	$4004\,l10$	$< 0{,}301029997$
1,000035441215	I = G + 2 H =	$28738\,l2-$	$8651\,l10$	$> 0{,}3010299951$
0,999971720830	K = H + I =	$42039\,l2-$	$12655\,l10$	$< 0{,}3010299959$
1,000007161046	L = I + K =	$70777\,l2-$	$21306\,l10$	$> 0{,}30102999562$
0,999993203514	M = K + 3 L =	$254370\,l2-$	$76573\,l10$	$< 0{,}30102999567$
1,000000364511	N = L + M =	$325147\,l2-$	$97879\,l10$	$> 0{,}3010299956635$
0,999999764687	O = M + 18 N =	$6107016\,l2-$	$1838335\,l10$	$< 0{,}3010299956640$
comp. ar. 235313				
$0 = 364511\,O + 235313\,N =$		$23025858251871\,l2-$	$6931474009721\,l10$	$> 0{,}30102999566398\frac{7}{10}$

multiplying the two numbers in the first column together, there is produced a third number 1,024, against which is written C, for its logarithm, expressing likewise by an equation in what manner C is formed of the foregoing logarithms A and B. And in the same manner the calculation is continued throughout; only observing this compendium, that before multiplying the two last numbers already entered in the table, to consider what power of one of them must be used to bring the product the nearest that can be to unity. Now, after having continued the table a little way, this is found by only dividing the differences of the numbers from unity one by the other, and taking the nearest quotient for the index of the power sought. Thus, the second and third numbers in the table being 0,8 and 1,024, their differences from unity are 0,200 and 0,024; hence 0,200 ÷ 0,024 gives 9 for the index; and therefore multiplying the 9th power of 1,024 by 0,8 produces the next number 0,990352031429, whose logarithm is D = B + 9 C.

When the calculation is continued in this manner till the numbers become small enough, or near enough to 1, the last logarithm is supposed equal to nothing, which gives an equation expressing the relation of the logarithms, and from whence the required logarithm is determined. Thus, supposing G = 0, we have $2136\,l2 - 643\,l10 = 0$, and hence, because the logarithm of 10 is 1, we obtain $l\,2 = \frac{643}{2136} = 0{,}30102996$, too small in the last figure; which so happens because the number corresponding to G is greater than 1. And in this manner are all the numbers in the third or last column obtained, which are continual approximations to the logarithms of 2.

There is another expedient which renders this calculation ſtill ſhorter, and it is founded on this conſideration; that when x is ſmall, $\overline{1+x}^m$ is nearly $= 1 + nx$. Hence if $1 + x$ and $1 - z$ be the two laſt numbers already found in the firſt column of the table, the product of their powers $\overline{1+x}^m \times \overline{1-z}^n$ will be nearly $= 1$; and hence the relation of m and n may be thus found, $\overline{1+x}^m \times \overline{1-z}^n$ is nearly $= \overline{1+mx} \times \overline{1-nz} = 1 + mx - nz - mn\,xz = 1 + mx - nz$ nearly, which being alſo $= 1$ nearly, therefore $m : n :: z : x :: l\overline{1-z} : l.\overline{1+x}$; whence $x\,l.\overline{1-z} + z\,l.\overline{1+x} = 0$. For example, let 1,024 and 0,990352 be the laſt numbers in the table, their logarithms being C and D: here we have $1{,}024 = 1 + x$, and $0{,}990352 = 1 - z$; conſequently $x = 0{,}024$, and $z = 0{,}009648$; and hence the ratio $\frac{m}{n}$ in ſmall numbers is $\frac{201}{500}$. So that for finding the logarithms propoſed, we may take $500\,D + 201\,C = 48510\,l\,2 - 14603\,l\,10 = 0$; which gives $l\,2 = 0{,}3010307$. And in this manner are found the numbers in the laſt line of the table.

Of Mr. Long's Method.

In number 339 of the Philoſophical Tranſactions, are given a brief table and method for finding the logarithm to any number, and the number to any logarithm, by Mr. John Long, B. D. Fellow of C. C. C. Oxon. This table and method are ſimilar to thoſe deſcribed in chap. 14 of Briggs's *Arith. Logar.* differing only in this, that in this table by Mr. Long, the logarithms, in each claſs, are in arithmetical progreſſion, the common difference being 1; but in Briggs's little table the column of natural numbers has the like common difference. The table conſiſts of eight claſſes of logarithms and their correſponding numbers as follows:

Log.	Nat. Numb.	Log.	Nat. Numb.	Log.	Nat. Numb.	Log.	Nat. Numb.
,9	7,943282347	,009	1,0209,9484	,00009	1,000207254	,0000009	1,000002072
,8	6,309573445	8	1,018591388	8	1,000184224	8	1,000001842
,7	5,011872336	7	1,016248694	7	1,000161194	7	1,000001611
,6	3,981071706	6	1,013911386	6	1,000138165	6	1,000001381
,5	3,162277660	5	1,011579454	5	1,000115136	5	1,000001151
,4	2,511886432	4	1,009252886	4	1,000092106	4	1,000000921
,3	1,995262315	3	1,006931669	3	1,000069080	3	1,000000690

2	1,047128548	2	1,000460623	2	1,000004605	2	1,000000046
1	1,023292992	1	1,000230285	1	1,000002302	1	1,000000023

where,

where, becauſe the logarithms in each claſs are the continual multiples 1, 2, 3, &c, of the loweſt, it is evident that the natural numbers are ſo many ſcales of geometrical proportionals, the loweſt being the common ratio, or the aſcending numbers are the 1, 2, 3, &c powers of the loweſt, as expreſſed by the figures 1, 2, 3, &c of their correſponding logarithms. Alſo the laſt number in the firſt, ſecond, third, &c claſs, is the 10th, 100th, 1000th, &c root of 10; and any number in any claſs is the 10th power of the correſponding number in the next following claſs.

To find the logarithm of any number, as ſuppoſe of 2000, by this table: Look in the firſt claſs for the number next leſs than the firſt figure 2, and it is 1,995262315, againſt which is 3 for the firſt figure of the logarithm ſought. Again, dividing 2 the number propoſed by 1,995262315 the number found in the table, the quotient is 1,002374467; which being looked for in the ſecond claſs of the table, and finding neither its equal nor a leſs, 0 is therefore to be taken for the ſecond figure of the logarithm; and the ſame quotient 1,002374467 being looked for in the third claſs, the next leſs is there found to be 1,002305238, againſt which is 1 for the third figure of the logarithm; and dividing the quotient 1,002374467 by the ſaid next leſs number 1,002305238, the new quotient is 1,000069070; which being ſought in the fourth claſs gives 0, but ſought in the fifth claſs gives 2, which are the fourth and fifth figures of the logarithm ſought: again, dividing the laſt quotient by 1,000046053 the next leſs number in the table, the quotient is 1,000023015, which gives 9 in the 6th claſs for the 6th figure of the logarithm ſought: and again dividing the laſt quotient by 1,000020724 the next leſs number, the quotient is 1,000002291, the next leſs than which in the 7th claſs gives 9 for the 7th figure of the logarithm: and dividing the laſt quotient by 1,000002072, the quotient is 1,000000219, which gives 9 in the 8th claſs for the 8th figure of the logarithm: and again the laſt quotient 1,000000219 being divided by 1,000000207 the next leſs, the quotient 1,000000012 gives 5 in the ſame 8th claſs, when one figure is cut off, for the 9th figure of the logarithm ſought. All which figures collected together give 3,301029995 for Briggs's logarithm of 2000, the index 3 being ſupplied; which logarithm is true in the laſt figure.

To find the number anſwering to any given logarithm, as ſuppoſe to 3,3010300: omitting the characteriſtic, againſt the other figures 3,0,1,0,3,0,0, as in the firſt column in the margin, are the ſeveral numbers as in the 2d column, found from their reſpective 1ſt, 2d, 3d, &c claſſes; the effective numbers of which multiplied continually together, the laſt product is 2,000000019966, which, becauſe the characteriſtic is 3, gives 2000,000019966 or 2000 only for the required number anſwering to the given logarithm.

Of Mr. Jones's Method.

In the 61ſt volume of the Philoſophical Tranſactions, is a ſmall paper on logarithms, which had been drawn up and left unpubliſhed, by the learned and ingenious William Jones, Eſq. The method contained in this memoir, depends on an application of the doctrine of fluxions, to ſome properties drawn from the nature of the exponents of powers. Here all numbers are conſidered as ſome certain powers of a conſtant determinate root: ſo any number x may be conſidered as the z power of any root r, or that $x = r^z$ is a general expreſſion of all numbers in terms of the conſtant root r and a variable exponent z. Now the index z being the logarithm of the number x, therefore to find this logarithm, is the ſame thing as to find what power of the radical r is equal to the number x.

From this principle, the relation between the fluxions of any number x and its logarithm z is thus determined: put $r = 1 + n$; then is $x = r^z = \overline{1+n}^z$, and $x + \dot{x} = \overline{1+n}^{z+\dot{z}} = \overline{1+n}^z \times \overline{1+n}^{\dot{z}} = x \times \overline{1+n}^{\dot{z}} =$ (by expanding $\overline{1+n}^{\dot{z}}$, omitting the 2d, 3d, &c powers of $\dot{x}$, and writing q for $\frac{n}{1+n}$) $x + x\dot{z} \times : q + \frac{1}{2}q^2 + \frac{1}{3}q^3 + \frac{1}{4}q^4$ &c;

therefore $\dot{x} = ax\dot{z}$, putting a for the ſeries $q + \frac{1}{2}q^2 + \frac{1}{3}q^3$ &c,

or $f\dot{x} = x\dot{z}$, putting $f = \frac{1}{a}$.

Now when $r = 1 + n = 10$, as in the common logarithms of Briggs's form; then $n = 9$, $q = ,9$, and the ſeries $q + \frac{1}{2}q^2 + \frac{1}{3}q^3$ &c gives $a = 2,302585$ &c, and therefore its reciprocal $f = ,434294$ &c. But if $a = 1 = f$, the form will be that of Napier's logarithms.

From the above form $x\dot{z} = f\dot{x}$, or $\dot{z} = \frac{f\dot{x}}{x}$, are then deduced many curious and general properties of logarithms, with the ſeveral ſeries heretofore given by Gregory, Mercator, Wallis, Newton, and Halley. But of all theſe ſeries, that one which our author ſelects for conſtructing the logarithms, is this; putting $N = \frac{r-p}{r+p}$, the logarithm of $\frac{r}{p}$ is $= 2f \times : N + \frac{1}{3}N^3 + \frac{1}{5}N^5 + \frac{1}{7}N^7$ &c in the caſe in which $r - p$ is $= 1$, and conſequently then $N = \frac{1}{2r-1}$ or $\frac{1}{2p+1}$; which ſeries will then converge very faſt.

Hence, having given any numbers, p, q, r, &c, and as many ratios a, b, c, &c, compoſed of them, the difference between the two terms of each ratio being 1; as alſo the logarithms A, B, C, &c

of

of thoſe ratios given: to find the logarithms P, Q, R, &c of thoſe numbers; ſuppoſing $f = 1$. For inſtance, if $p = 2$, $q = 3$, $r = 5$; and $a = \frac{9}{8} = \frac{3^2}{2^3}$, $b = \frac{16}{15} = \frac{2^4}{3 \cdot 5}$, $c = \frac{25}{24} = \frac{5^2}{3 \cdot 2^3}$. Now the logarithms A, B, C, of theſe ratios a, b, c, being found by the above ſeries, from the nature of powers we have theſe three equations,

$$\left.\begin{array}{l} A = 2Q - 3P \\ B = 4P - Q - R \\ C = 2R - Q - 3P \end{array}\right\} \text{which equations reduced give} \left\{\begin{array}{l} P = 3A + 4B + 2C = \log. \text{ of } 2, \\ Q = 5A + 6B + 3C = \log. \text{ of } 3, \\ R = 7A + 9B + 5C = \log. \text{ of } 5. \end{array}\right.$$

And hence $P + R = 10A + 13B + 7C$ is $=$ the logarithm of 2×5 or 10.

An elegant tract on logarithms, as a comment on Dr. Halley's method, was alſo given by Mr. Jones in his *Synopſis Palmariorum Matheſeos*, publiſhed in the year 1706. And in the Philoſophical Tranſactions he communicated various improvements in goniometrical properties, and the ſeries relating to the circle and to trigonometry.

The memoir above deſcribed was delivered to the Royal Society by their then librarian, Mr. John Robertſon, a worthy, ingenious, and induſtrious man; who alſo communicated to the Society ſeveral little tracts of his own relating to logarithmical ſubjects: he was alſo the author of an excellent Treatiſe on the Elements of Navigation in two volumes; and he was ſucceſſively mathematical maſter to Chriſt's hoſpital in London; head maſter to the royal naval academy at Portſmouth; and librarian, clerk, and houſekeeper to the Royal Society; at whoſe houſe, in Crane Court, Fleet Street, he died in 1776, aged 64 years.

And among the papers of Mr. Robertſon, I have, ſince his death, found one containing the following particulars relating to Mr. Jones, which I here inſert, as I know of no other account of his life, &c. and as any true anecdotes of ſuch extraordinary men muſt always be acceptable to the learned. This paper is not in Mr. Robertſon's hand writing, but in a kind of running law-hand, and is ſigned R. M. 12 Sept. 1771.

"William Jones, Eſq. F. R. S. was born at the foot of Bodavon mountain, [Mynydd Bodafon] in the pariſh of Llanfihangel tre'r Bardd, in the iſle of Angleſey, North Wales, in the year 1675. His father John George * was a farmer, of a good family, being deſcended from Hwfa ap Cynddelw, one of the 15 tribes of North Wales. He gave his two ſons the common ſchool education of the country, reading, writing, and accounts, in Engliſh, and the Latin

* "It is the cuſtom in ſeveral parts of Wales for the name of the father to become the ſurname of his children. John George the father was commonly called Sion Siors of Llanbabo, to which pariſh he moved, and where his children were brought up."

grammar

grammar. Harry his ſecond ſon took to the farming buſineſs; but William the eldeſt, having an extraordinary turn for mathematical ſtudies, determined to try his fortune abroad from a place where the ſame was but of little ſervice to him; he accordingly came to London, accompanied by a young man Rowland Williams, afterwards an eminent perfumer in Wych Street. The report in the country is, that Mr. Jones ſoon got into a merchant's counting houſe, and ſo gained the eſteem of his maſter, that he gave him the command of a ſhip for a Weſt India voyage; and that upon his return he ſet up a mathematical ſchool, and publiſhed his book of navigation *; and that upon the death of the merchant he married his widow: that Lord Macclesfield's ſon being his pupil, he was made ſecretary to the chancellor, and one of the D. tellers of the exchequer—and they have a ſtory of an Italian wedding which cauſed great diſturbance in Lord Macclesfield's family, but compromiſed by Mr. Jones; which gave riſe to a ſaying, that Macclesfield was the making of Jones, and Jones the making of Macclesfield."

Mr. Jones died July 3, 1749, being vice-preſident of the Royal Society; and left one daughter, and his widow with child, which proved a ſon, who is the preſent Sir William Jones, now one of the judges in India, and highly eſteemed for his great abilities, extenſive learning, and eminent patriotiſm.

Of Mr. Andrew Reid and Others.

Andrew Reid, Eſq. publiſhed in 1767 a quarto tract under the title of *An Eſſay on Logarithms*, in which he alſo ſhews the computation of logarithms from principles depending on the binomial theorem and the nature of the exponents of powers, the logarithms of numbers being here conſidered as the exponents of the powers of 10. He hence brings out the uſual ſeries for logarithms, and largely exemplifies Dr. Halley's moſt ſimple conſtruction.

Beſides the authors whoſe methods have been here particularly deſcribed, many others have treated on the ſubjects of logarithms, and of the ſines, tangents, ſecants, &c; among the principal of whom are Leibnitz, Euler, Maclaurin, Wolfius, and profeſſor Simſon in an elegant geometrical tract on logarithms, contained in his poſthumous works, elegantly printed in 4to. at Glaſgow in the year 1776, at the expence of the very learned Earl Stanhope, and by his Lordſhip diſpoſed of in preſents among gentlemen moſt eminent for mathematical learning.

* This tract on navigation, intituled, "A New Compendium of the whole Art of Practical Navigation," was publiſhed in 1702, and dedicated "to the reverend and learned Mr. John Harris M. A. and F. R. S." the author I apprehend of the "Univerſal Dictionary of Arts and Sciences," under whoſe roof Mr. Jones ſays he compoſed the ſaid treatiſe on Navigation.

Of

Of Mr. Dodſon's Anti-logarithmic Canon.

The only remaining conſiderable work of this kind publiſhed, that I know of, is the Anti-logarithmic Canon of Mr. James Dodſon, a very ingenious mathematician, which work he publiſhed in folio in the year 1742; a very great performance, containing all logarithms under 100000, and their correſponding natural numbers to 11 places of figures, with all their differences and the proportional parts; the whole arranged in the order contrary to that uſed in the common tables of numbers and logarithms, the exact logarithms being here placed firſt, and increaſing continually by 1, from 1 to 100000, and their correſponding neareſt numbers in the columns oppoſite to them; and by means of the differences and proportional parts, the logarithm to any number, or the number to any logarithm, each to 11 places of figures, is readily found. This work contains alſo, beſides the conſtruction of the natural numbers to the given logarithms, "precepts and examples, ſhewing ſome of the uſes of logarithms, in facilitating the moſt difficult operations in common arithmetic, caſes of intereſt, annuities, menſuration, &c; to which is prefixed an introduction, containing a ſhort account of logarithms, and of the moſt conſiderable improvements made, ſince their invention, in the manner of conſtructing them."

The manner in which theſe numbers were conſtructed, conſiſts chiefly in imitations of ſome of the methods before deſcribed by Briggs, and is nothing more than generating a ſcale of 100000 geometrical proportionals from 1 the leaſt term to 10 the greateſt, each continued to 11 places of figures; and the means of effecting this are ſuch as eaſily flow from the nature of a ſeries of proportionals, and are briefly as follows. Firſt between 1 and 10 are interpoſed 9 mean proportionals; then between each of theſe 11 terms there are interpoſed 9 other means, making in all 101 terms; then between each of theſe a 3d ſet of 9 means, making in all 1001 terms; again between each of theſe a 4th ſet of 9 means, making in all 10001 terms; and laſtly between each two of theſe terms, a 5th ſet of 9 means, making in all 100001 terms, including both the 1 and the 10. The firſt four of theſe 5 ſets of means, are found each by one extraction of the 10th root of the greater of the two given terms, which root is the leaſt mean, and then multiplying it continually by itſelf according to the number of terms in the ſection or ſet; and the 5th or laſt ſection is made by interpoſing each of the 9 means by help of the method of differences before taught. Namely, putting 10 the greateſt term $= A$, $A^{\frac{1}{10}} = B$, $B^{\frac{1}{10}} = C$, $C^{\frac{1}{10}} = D$, $D^{\frac{1}{10}} = E$, and $E^{\frac{1}{10}} = F$; now extracting the 10th root of A or 10, it gives $1,25892541\,18 = B = A^{\frac{1}{10}}$ for the leaſt of the 1ſt ſet of means; and then multiplying it continually by itſelf, we have B, B^2, B^3, B^4, &c

&c to $B^{10} = A$ for all the 10 terms: 2dly, the 10th root of 1,2589254118 gives 1,0232929923 $= C = B^{\frac{1}{10}} = A^{\frac{1}{100}}$ for the leaſt of the 2d claſs of means, which being continually multiplied gives C, C^2, C^3, &c to $C^{100} = B^{10} = A$ for all the 2d claſs of 100 terms: 3dly, the 10th root of 1,0232929923 gives 1,002305238 1 $= D = C^{\frac{1}{10}} = B^{\frac{1}{100}} = A^{\frac{1}{1000}}$ for the leaſt of the 3d claſs of means, which being continually multiplied gives D, D^2, D^3, &c to $D^{1000} = C^{100} = B^{10} = A$ for the 3d claſs of 1000 terms: 4thly, the 10th root 1,0023052381 gives 1,0002302850 $= E = D^{\frac{1}{10}} = C^{\frac{1}{100}} = B^{\frac{1}{1000}} = A^{\frac{1}{10000}}$ for the leaſt of the 4th claſs of means, which being continually multiplied gives E, E^2, E^3, &c to $E^{10000} = D^{1000} = C^{100} = B^{10} = A$ for the 4th claſs of 10000 terms. Now theſe 4 claſſes of terms thus produced, require no leſs than 11110 multiplications of the leaſt means by themſelves; which however are much facilitated by making a ſmall table of the firſt 10 or even 100 products of the conſtant multiplier, and from thence only taking out the proper lines and adding them together: and theſe 4 claſſes of numbers always prove themſelves at every 10th term, which muſt always agree with the correſponding ſucceſſive terms of the preceding claſs. The remaining 5th claſs is conſtructed by means of differences, being much eaſier than the method of continual multiplication, the 1ſt and 2d differences only being uſed, as the 3d difference is too ſmall to enter the computation of the ſets of 9 means between each two terms of the 4th claſs. And the ſeveral 2d differences for each of theſe ſets of 9 means, are found from the properties of a ſet of proportionals 1, r, r^2, r^3, &c, as diſpoſed in the 1ſt column of the annexed table, and their ſeveral orders of differences as in the other columns of the table; where it is evident that each column, both that of the given terms of the progreſſion, and thoſe of their orders of differences, forms a ſcale of proportionals, having the ſame common ratio r; and that each horizontal line or row forms a geometrical progreſſion having all the ſame common ratio $r - 1$, which is alſo the 1ſt difference of each ſet of means; ſo $\overline{r-1}^2$ is the 1ſt of the 2d differences, and which is conſtantly the ſame, as the 3d differences become too ſmall in the required terms of our progreſſion to be regarded, at leaſt near the beginning of the table: hence, like as 1, $r-1$, and $\overline{r-1}^2$ are the 1ſt term with its 1ſt and 2d differences; ſo r^n, $r^n \cdot \overline{r-1}$, and $r^n \cdot \overline{r-1}^2$ are any other term with its 1ſt and 2d differences. And by this rule the 1ſt and 2d differences are to be found for every ſet of 9 means, viz. multiplying the 1ſt term

Terms	1ſt dif.	2d dif.	3d dif.	&c
$1 \times$	$\overline{r-1} \times$	$\overline{r-1}^2 \times$	$\overline{r-1}^3 \times$	
1	1	1	1	
r	r	r	r	
r^2	r^2	r^2	r^2	&c
r^3	r^3	r^3	r^3	
&c	&c	&c	&c	

term of any claſs (which will be the ſeveral terms of the ſeries E, E^2, E^3, &c, or every 10th term of the ſeries F, F^2, F^3, &c) by $r-1$ or $F-1$ for the 1ſt difference, and this multiplied by $F-1$ again for the true 2d difference at the beginning of that claſs. Thus the 10th root of 1,0002302850 or E gives 1,000023026116 for F or the 1ſt mean of the loweſt claſs, therefore $F-1=r-1=$,000023026116 is its 1ſt difference, and the ſquare of it is $\overline{r-1}^2$ =,000000005302 its 2d difference; then is ,000023026116F^{10n} or ,000023026116E^n the 1ſt difference, and ,000000005302F^{20n} or ,000000005302E^{2n} is the 2d difference at the beginning of the nth claſs of decades. And this 2d difference is uſed as the conſtant 2d difference through all the 10 terms, except towards the end of the table where the differences increaſe faſt enough to require a ſmall correction of the 2d difference, and which Mr. Dodſon effects by taking a mean 2d difference among all the 2d differences in this manner; having found the ſeries of 1ſt differences $\overline{F-1}.E^n$, $\overline{F-1}.E^{n+1}$, $\overline{F-1}.E^{n+2}$, &c, take the differences of theſe, and $\frac{1}{10}$ of them will be the mean 2d differences to be uſed, namely $\frac{F-1}{10}\cdot\overline{E^{n+1}-E^n}$, $\frac{F-1}{10}\cdot\overline{E^{n+2}-E^{n+1}}$, &c are the mean 2d differences. And this is not only the more exact but alſo the eaſier way. The common 2d difference and the ſucceſſive 1ſt differences are then continually added through the whole decade, to give the ſucceſſive terms of the required progreſſion.

DESCRIPTION

AND USE OF

LOGARITHMIC TABLES.

ALTHOUGH the nature and conſtruction of logarithms have been pretty fully treated in the preceding hiſtory of ſuch numbers, where the more learned and curious reader will find abundant ſatisfaction, I ſhall here give a brief, eaſy, and familiar idea of theſe matters, for the practical uſe of young ſtudents in this ſubject.

The Definition and Notation of Logarithms.

Logarithms are the indices, or arithmetical ſeries of numbers, adapted to the terms of a geometrical ſeries, in ſuch ſort that 0 correſponds to, or is the index of, 1 in the geometricals.

Thus	0	1	2	3	4	5,	&c. indices or logarithms,
	1	2	4	8	16	32,	&c. geometric progreſſion,
or	0	1	2	3	4	5,	&c. indices or logarithms,
	1	3	9	27	81	243,	&c. geometric ſeries.
or	0	1	2	3	4	5,	&c. indices or logarithms,
	1,	10,	100,	1000,	10000,	100000,	&c. geometric ſeries.

Where the ſame indices ſerve equally for any geometric ſeries; and from which it is evident that there may be an endleſs variety of ſyſtems of logarithms to the ſame common numbers, by varying the 2d term 2, or 3, or 10, &c, of the geometric ſeries; as this will change the original ſeries of terms whoſe indices are the whole numbers, 1, 2, 3, &c; and by interpolation the whole ſyſtem of numbers may be made to enter the geometrical ſeries, and receive their proportional logarithms, whether integers or decimals.

Or, the logarithm of any number is the index of that power of ſome other number, which is equal to the given number. So if N be $= r^n$, then the logarithm of N is n, which may be either poſitive or negative, and r any number whatever, according to the different ſyſtems of logarithms. When N is 1, then $n = 0$, whatever the value of r is; and conſequently the logarithm of 1 is always 0 in every ſyſtem of logarithms. When n is $= 1$, then N is $= r$; conſequently r is always the number whoſe logarithm is 1 in every ſyſtem. When r is $= 2{\cdot}71828\,18284\,59$ &c, the indices are the hyperbolic logarithms, ſuch as in our 7th table; ſo that n is the hyperbolic logarithm of $\overline{2{\cdot}718\,\&c.}^{n}$. But in the common logarithms r is

is = 10; so that the common logarithm of any number (10^n) is (n) the index of that power of 10 which is equal to the said number. So 1000, being the 3d power of 10, has 3 for its logarithm; and if 50 be = $10^{1.69897}$, then is 1·69897 the common logarithm of 50. And hence it follows that this decimal series of terms

10^4, 10^3, 10^2, 10^1, 10^0, 10^{-1}, 10^{-2}, 10^{-3}, 10^{-4},
or 10000, 1000, 100, 10, 1, ·1, ·01, ·001, ·0001,
have 4, 3, 2, 1, 0, −1, −2, −3, −4,

respectively for their logarithms.

The logarithm of a number comprehended between any two terms of the first series, is included between the two corresponding terms of the latter, and therefore that logarithm will consist of the same index (whether positive or negative) as the less of those two terms, together with a decimal fraction, which will always be positive. So the number 50, falling between 100 and 10, its logarithm will fall between 2 and 1, and is = 1·69897, the index of the less term together with the decimal ·69897: also the number ·05, falling between the terms ·1 and ·01, its logarithm will fall between −1 and −2, and is indeed = −2 + ·69897, the index of the less term together with the decimal ·69897. The index is also called the characteristic of the logarithms, and is always an integer, either positive or negative, or else = 0; and it shews what place is occupied by the first significant figure of the given number, either above or below the place of units, being in the former case + or positive, in the latter — or negative.

When the characteristic of a logarithm is negative, the sign — is commonly set over it, to distinguish it from the decimal part, which being the logarithm found in the tables, is always positive: so −2 + ·69897, or the logarithm of ·05, is written thus $\bar{2}$·69897. But on some occasions it is convenient to reduce the whole expression to a negative form; which is done by making the characteristic figure less by 1, and taking the arithmetical complement of the decimal, that is, beginning at the left hand, subtract each figure from 9, except the last significant figure, which subtract from 10; so shall the remainders form the logarithm intirely negative. Thus the logarithm of ·05, which is $\bar{2}$·69897 or −2 + ·69897, is also expressed by −1·30103, which is wholly negative. It is also sometimes thought more convenient to express such logarithms wholely as positive, namely by only joining to the tabular decimal the complement of the index to 10; in which way the above logarithm is expressed by 8·69897; which is only increasing the indices in the scale by 10. It is also convenient, in many operations with logarithms, to take their arithmetical complements, which is done by beginning at the left hand, and subtracting every figure from 9, but the last figure from 10: so the arithmetical complement of 1·69897 is 8·30103, and of $\bar{2}$·69897 it is 11·30103, where the index −2, being negative, is added to 9, and makes 11.

The Properties of Logarithms.

From the definition of logarithms, either as being the indices of a ſeries of geometricals, or as the indices of the powers of the ſame root, it follows that the multiplication of the numbers will anſwer to the addition of their logarithms; the diviſion of numbers to the ſubtraction of their logarithms; the raiſing of powers, to the multiplying the logarithm of the root by the index of the power; and the extracting of roots, to the dividing the logarithm of the given number by the index of the root required to be extracted: So

1ſt. L. ab or $a \times b$ is $=$ L. a + L. b

L. 18 or 3×6 is $=$ L. 3 + L. 6

L. $5 \times 9 \times 73$ is $=$ L. 5 + L. 9 + L. 73

2d. L. $a \div b$ is $=$ L. a — L. b

L. $18 \div 6$ is $=$ L. 18 — L. 6

L. $79 \times 5 \div 9$ is $=$ L. 79 + L. 5 — L. 9

L. $\frac{1}{2}$ or $1 \div 2$ is $=$ L. 1 — L. 2 $=$ 0 — L. 2 $=$ — L. 2

L. $\frac{1}{n}$ or $1 \div n$ is $=$ — L. n

3d. L. r^n is $= n$ L. r; L. $r^{\frac{1}{n}}$ or L. $\sqrt[n]{r}$ is $= \frac{1}{n}$ L. r; L. $r^{\frac{m}{n}}$ is $= \frac{m}{n}$ L. r.

L. 2^6 is $= 6$ L. 2; L. $2^{\frac{1}{3}}$ or L. $\sqrt[3]{2}$ is $= \frac{1}{3}$ L. 2; L. $2^{\frac{3}{5}}$ is $= \frac{3}{5}$ L. 2.

So that any number and its reciprocal have the ſame logarithm, but with contrary ſigns; and the ſum of the logarithms of any number and its complement, is equal to 0.

To conſtruct Logarithms.

It has been ſhewn in the foregoing hiſtorical part, that the logarithm of $\frac{b}{a}$ is $= \frac{2}{m} \times : \frac{x}{z} + \frac{x^3}{3z^3} + \frac{x^5}{5z^5} + \frac{x^7}{7z^7}$ &c; where z is the ſum, and x the difference of a and b; alſo $m = 2{\cdot}302585092994$ &c, the hyp. logarithm of 10. Therefore if a and b be any two numbers differing only by unity, ſo that x or $b - a$ may be $= 1$; then ſhall the logarithm of b be $=$ L. $a + \frac{2}{m} \times : \frac{1}{z} + \frac{1}{3z^3} + \frac{1}{5z^5}$ &c.

Which gives this rule in words at length: call z the ſum of any number (whoſe logarithm is ſought) and the number next leſs by unity; divide ·8685889638 &c (or $2 \div 2.3025$ &c) by z, and reſerve the quotient; divide the reſerved quotient by the ſquare of z, and reſerve this quotient; divide this laſt quotient alſo by the ſquare of z, and again reſerve this quotient: and thus proceed continually dividing the laſt quotient by the ſquare of z, as long as diviſion can be

be made. Then write these quotients orderly under one another, the first uppermost, and divide them respectively by the uneven numbers 1, 3, 5, 7, 9, 11, &c, as long as division can be made; that is, divide the first reserved quotient by 1, the 2d by 3, the 3d by 5, the 4th by 7, &c. Add all these last quotients together, and the sum will be the logarithm of $b \div a$; and therefore to this logarithm add also the logarithm of a the next less number, and the sum will be the required logarithm of b the number proposed.

Ex. 1. *To find the Log. of* 2.

Here the next less number is 1, & 2 + 1 = 3 = z, whose square is 9. Then

3)	·868588964	1)·289529654(·289529654
9)	·289529654	3) 32169962(10723321
9)	32169962	5) 3574440(714888
9)	3574440	7) 397160(56737
9)	397160	9) 44129(4903
9)	44129	11) 4903(446
9)	4903	13) 545(42
9)	545	15) 61(4
9)	61	

Log. $\frac{2}{1}$ - - ·301029995
Add L. 1 - ·000000000
Log. of 2 - ·301029995

Ex. 2. *To find the Log. of* 3.

Here the next less number is 2, and 2 + 3 = 5 = z, whose square is 25, to divide by which always multiply by ·04. Then

5	)·868588964	1)·173717793(·173717793
25)	·173717793	3) 6948712(2316237
25)	6948712	5) 277948(55590
25)	277948	7) 11118(1588
25)	11118	9) 448(50
25)	445	11) 18(2
	18	

L. $\frac{1}{2}$ - - ·176091260
L. 2 add - ·301029995
L. 3 - - ·477121255

Then because the sum of the logarithms of numbers gives the logarithm of their product, and the difference of the logarithms gives the logarithm of the quotient of the numbers, from the above two logarithms, and the logarithm of 10, which is 1, we may raise a great many logarithms thus:

Ex. 3. Because $2 \times 2 = 4$, therefore
to L. 2 - - ·301029995$\frac{2}{3}$
add L. 2 - ·301029995$\frac{2}{3}$
sum is L. 4 ·602059991$\frac{1}{3}$

Ex. 4. Because $2 \times 3 = 6$, therefore
to L. 2 - ·301029995
add L. 3 - ·477121255
sum is L. 6 - ·778151250

Ex. 5. Because $2^3 = 8$, therefore
L. 2. - ·301029995$\frac{2}{3}$
mult. by - 3
gives L. 8 - ·903089987

Ex. 6. Because $3^2 = 9$, therefore
L. 3 - ·477121254$\frac{7}{6}$
mult. by - 2
gives L. 9 - ·954242509

Ex. 7. Because $\frac{10}{2} = 5$, therefore
from L. 10 - 1·000000000
take L. 2 - ·301029995$\frac{2}{3}$
leaves L. 5 - ·698970004$\frac{2}{3}$

Ex. 8. Because $12 = 3 \times 4$, therefore
to L. 3 - ·477121255
add L. 4 - ·602059991
gives L. 12 - 1·079181246

And thus by computing, by the general rule, the logarithms of the other prime numbers 7, 11, 13, 17, 19, 23, &c; and then using composition and division, we may easily find as many logarithms as we please, or may speedily examine any logarithm in the table.

THE

THE DESCRIPTION AND USE OF THE TABLES.

THE following collection conſiſts of various tables, in this order, viz. 1, A large table of logarithms to 7 places of figures; 2, A table for finding logarithms and numbers to 20 places; 3, Logarithms to 20 places, with their 1ſt, 2d, and 3d differences; 4, Another table of logarithms to 20 places, with their 1ſt, 2d, and 3d differences; 5, Logarithms to 61 places; 6, Another table of logarithms to 61 places, with their 1ſt, 2d, 3d, and 4th differences; 7, Hyperbolic logarithms; 8, Logiſtic logarithms; 9, Logarithmic ſines and tangents to every ſecond of the firſt 2 degrees; 10, Natural and logarithmic ſines, tangents, ſecants, and verſed ſines, with their differences to every minute of the quadrant. After which follow ſeveral ſmaller tables; as a table of the lengths of circular arcs; a traverſe table, or table of difference of latitude and departure, to every degree and quadrant point of the compaſs; a table for changing the common logarithms into hyperbolic logarithms; and a table of the names and number of degrees &c. in every point of the compaſs; as alſo liſts of errata in various works of this ſort. Of each of which in their order.

Of the large Table of Logarithms.

The firſt is the large table of logarithms to all numbers from 1 to 100000, by which may be found the logarithm to any number and the number to any logarithm to 7 places of figures. This table conſiſts of two parts; the firſt contains, in 4 pages, the firſt 1000 numbers with their correſponding logarithms in adjacent columns; the ſecond contains all the 100000 numbers and their logarithms, with the differences and proportional parts, diſpoſed as follows: in the 1ſt column of each page are the firſt 4 figures of the numbers, and along the top and bottom of the columns is the 5th figure, in which columns are placed all the logarithms, the firſt 3 figures of each logarithm being at the beginning of the lines in the firſt column of logarithms, ſigned 0 at the top and bottom, and the other 4 figures in the remaining columns. After the 10 columns of logarithms ſtands their column of differences, ſigned D; and laſtly after that, as alſo at the bottom of ſome pages, the column of proportional parts, ſigned pro. pts. ſhewing what proportional part of each difference correſponds to 1, 2, 3, &c, the whole difference anſwering to 10; or ſhewing the $\frac{1}{10}$, $\frac{2}{10}$, $\frac{3}{10}$, &c, of the differences.

Note, the logarithms in theſe columns are all ſuppoſed to be decimals, and their correſponding natural numbers may be either integers or decimals or mixt numbers, for the ſame figures, whatever be their

their denomination, have the ſame decimal logarithm, and theſe differ only in the index or characteriſtic, which is the integer number to be prefixed to the decimal part of the logarithm; and this is always the number which expreſſes the diſtance of the higheſt denomination, or left-hand figure, of the natural number, from the units place. So that if the natural number conſiſt of only one place of integers, the index of its log. will be 0; if of 2, 3, 4, 5, &c, the index of its logarithm will be reſpectively 1, 2, 3, 4, &c, being 1 leſs than the number of integer places: and the ſame figures made negative will give the index of the logarithm of a decimal, viz. if the natural number be a decimal, and its firſt ſignificant figure be in the place of primes, 2ds, 3ds, 4ths, &c. the index of its logarithm will be reſpectively $\bar{1}$, $\bar{2}$, $\bar{3}$, $\bar{4}$, &c. till the figure which expreſſes the diſtance of the firſt place of the natural number from the units place, but with a negative ſign, as the number is below the place of units, the ſign being written above the index inſtead of before it, as that part only of the logarithms is to be conſidered as negative, the decimal part of it being always affirmative. And in the arithmetical operations of addition and ſubſtraction with logarithms, the negative indexes will have the contrary effect to that of the decimal part of the logarithm, viz. when the logarithm is to be added, the figure of the negative index muſt be ſubſtracted, *& vice verſa*. Hence if 423409 be the tabular or decimal part of the logarithm belonging to the figures 2651, without any regard to their particular denominations; then according as they are varied with reſpect to the number of decimals, as in the 1ſt annexed column, the index of their logarithm, and the compleat logarithm, will vary as in the 2d column here annexed. And hence, like as when the natural number is given, we find the index of its logarithm by counting how far its firſt figure on the left hand is from the units place; ſo when a logarithm is given, the denominations of the figures in its natural number will be found by placing the decimal point ſo, that the number of integer places may be 1 more than that of the index when poſitive, or by ſetting the firſt ſignificant figure in that decimal place, which is expreſſed by the number of the index when negative.

Number	Logar.
2651	3·4234097
265·1	2·4234097
26·51	1·4234097
2·651	0·4234097
·2651	$\bar{1}$·4234097
·02651	$\bar{2}$·4234097
·002651	$\bar{3}$·4234097

Of finding the Logarithm of a given Number, or the Number to a given Logarithm.

1. *To find the Logarithm of a Number conſiſting of* 3 *Figures.*

Find the number in the column of numbers in one of the firſt 4 pages of the table, and immediately on the right of it is its logarithm ſought. So the logarithm of 72 is 1·8573325, and the logarithm of 3·33 is 0·5224442, when the proper index is ſupplied.

2. *To*

2. *To find the Logarithm of a Number conſiſting of 4 Places.*

In the firſt column (ſigned N) in ſome one of the pages of the table after the firſt four, find the given number, then againſt it in the 2d column (ſigned 0) is the logarithm ſought. So the logarithm of 2254 is 3·3529539, and that of 31232 is 1·4958218.

3. *To find the Logarithm of a Number conſiſting of 5 Places.*

Find the firſt 4 figures of the given number in the firſt column as before, and the 5th figure at the top or bottom; then the 7 figures of the logarithm are found in two columns on the line of the firſt 4 figures of the given number, viz. the firſt 3 figures of the logarithm are the firſt 3 common figures of the 2d column (ſigned 0), and the laſt 4 figures are on the ſame line, but in the column ſigned with the 5th figure of the given number. So the logarithm of 23204 is 4·3655629, and that of 746·40 is 2·8729716, and that of ·083178 is 2·9200085.

Note, When the laſt four figures of the logarithm begins with a cipher, or any figure leſs than the laſt four in the 2d column begins with, then the firſt 3 common figures are thoſe in the next lower line: ſo in the laſt example the firſt 3 common figures are 920, and not 919.

4. *To find the Logarithm of a Number of 6 Places.*

Find the logarithm of the firſt 5 figures by the laſt article, and take the difference between that logarithm and the next following logarithm, or (which is the ſame) find the difference neareſt oppoſite in the laſt column but one, ſigned D; then under that difference in the laſt column (of proportional parts) and againſt the 6th figure of the given number, is the part to be added to the logarithm before found for the firſt 5 figures, the ſum being the logarithm ſought. So to find the logarithm of 3409·26. The logarithm of 34092, the firſt 5 figures, being 5326525, and the common difference 127, under which and againſt 6 in the laſt column is 76, which being added to the former logarithm, and the proper index prefixed, we have 3·5326601 for the whole logarithm required.

5. *To find the Logarithm of a Number of 7 Places.*

Find the logarithm of the firſt five figures by the 3d article, and of the ſixth figure by the 4th article; then for the logarithm of the 7th figure, divide its proportional part by 10, that is ſet it one place farther to the right hand than the laſt figure of the logarithm reaches; add all the three together, and their ſum will be the logarithm required.

Thus

Thus to find the logarithm of 3·409264. The ſeveral parts being taken out according to rule, and placed as in the margin, the ſum gives the whole logarithm ſought.

Numb.	Logar.
34092 - - - -	5326525
6 - - -	76
4 - -	5,1
3·409264 -	0.5326606

Note, In the ſame way we might take out the proportional part of an 8th figure, dividing its tabular part by 100, or ſetting it two places farther to the right hand than the firſt logarithm. Or the whole proportional part for any number of figures above five, may be found at once by multiplying the common tabular difference of the logarithms, found as before, by all the figures after the 5th, cutting off from the product as many figures as we multiply by, and adding the reſt to the logarithm of the firſt 5 figures before found. So in the laſt example above, having found the common difference 127, multiplying it by 64 the laſt two figures, cutting off two, add the reſt to the logarithm of the firſt 5, as in the margin.

127
64
508
762
81,23
5326525
0·5326606

For another example, ſuppoſe we wanted the logarithm of the following 8 figures 34092648. The operation by both methods will be as below.

34092 - - -	5326525	127
6 - - -	76	648
4 - -	5,1	1016
8 - -	1,02	508
34092648 - -	7·5326607	762
		82,296
		5326525
		7·5326607 the ſame as the other.

6. *To find the Logarithm of a Vulgar Fraction, or of a Mixt Number.*

Either reduce the vulgar fraction to a decimal, and find its logarithm as above. Or elſe (having reduced the mixt number to an improper fraction), ſubtract the logarithm of the denominator from the logarithm of the numerator, and the remainder will be the logarithm of the fraction ſought.

Ex. 1. To find the log. of $\frac{3}{16}$ or 0·1875.		*Ex.* 2. To find the log. of $13\frac{3}{4}$ or $\frac{55}{4}$	
From log. of 3 -	0· 4771213	From log. of 55 - -	1·7403627
Take log. of 16 -	1. 2041200	Take log. of 4 - -	0·6020600
Rem. log. of $\frac{3}{16}$ or ·1875	$\bar{1}$· 2730013	Leaves log. of $\frac{55}{4}$ or 13·75	1·1383027

7. *To find the natural Number anſwering to any given Logarithm.*

Find the firſt 3 figures, next after the index of the given logarithm, in the ſecond column, ſigned 0, and the other 4 figures on the ſame line in one of the nine following columns; if the figures of the logarithm be thus found exactly, on the ſame line in the firſt

column are the firſt four figures of the natural number, and the 5th is at the top or bottom of that column in which the laſt four figures of the log. were found. So to find the number anſwering to the logarithm 2·5890108. In pa. 64 I find the firſt three figures 589, and in column 6 of the line above are found the other four ·0108, (becauſe the firſt three common figures are ſuppoſed to begin at that part of the line above where they are placed); then on the ſame line in the column of numbers ſtand the firſt four figures 388·1, and 6 at the top of the column, making in all 388·16 for the number ſought; having placed the decimal point ſo as to make three integers, being 1 more than 2 the index of the given logarithm.

But if the given logarithm be not found exactly in the table, ſubtract the next leſs tabular logarithm from it, and look for the remainder in the proportional parts under the difference between the two tabular logarithms next leſs and greater than the given logarithm, and againſt it, or the part next leſs, is a 6th figure to be annexed to the five figures before found. And if the remainder be not found exactly in the proportional parts, ſubtract the next leſs part from it, and annex a cypher to this 2d remainder, then againſt the neareſt proportional part (either greater or leſs) is a 7th figure to be annexed to the ſix before found. And that figure will be the neareſt to the truth in that place, either too much or too little.

Ex. To find the number anſwering to the logarithm 1·2335678.

The next leſs tab. log. is the log. of 17122 viz. 2335545

1ſt rem. 133

The difference is 254, and the table of pro. pts. gives - - 5 for the part 127

2d rem. 60

- - 2 for the part - - 51

So that the number ſought is 17·12252, making two integers for the index 1.

Or the 6th and 7th figures may be found without the table of proportional parts, by dividing the firſt remainder by the tabular difference, annexing one cipher to the dividend for each figure to be found. So in the laſt example, the remainder 133, with two ciphers annexed, being divided by the tabular difference 254, as in the margin, the quotient gives 52 for the 6th and 7th figures, the ſame as before.

In like manner may be found the numbers to the following logarithms.

Logarith.	1·2345678	3·7343003	$\bar{1}$·0921406	$\bar{2}$·3710468	4·6123004	3·2946809
Numb.	17·16200	5·423758	·1236348	·02355303	40954·39	1970·974

OF

OF LOGARITHMICAL ARITHMETIC.

I. *Multiplication by Logarithms.*

Add together the logarithms of all the factors, and the sum is a logarithm, the natural number corresponding to which will be the product required.

Observing to add, to the sum of the affirmative indices, what is carried from the sum of the decimal parts of the logarithms.

And that the difference between the affirmative and negative indices is to be taken for the index to the logarithm of the product.

Ex. 1. To multiply 23·14 by 5·062.

23·14 its log. is	1·3643634
5·062 its log. is	0·7043221
Product 117·1347 - -	$\bar{2}$·0686855

Ex. 2. To mul. 2·581926 by 3·457291.

2·581926 its log. is	0·4119438
3·457291 - -	0·5387359
Prod. 8·92647 - -	0·9506797

Ex. 3. To mult. 3·902, and 597·16, and ·0314728 all together.

3·902 its log. is	0·5912873
597·16 - -	2·7760907
·0314728 - -	$\bar{2}$·4979353
Prod. 73·33533 - -	1·8653133

The $\bar{2}$ cancels the 2, and the 1 to carry from the decimals is set down.

Ex. 4. To mult. 35·86, and 2·1046, and 0·8372, and 0·0294 all together.

35·86 its log. is	0·5546103
2·1046 - -	0·3231696
0·8372 - -	$\bar{1}$·9228292
0·0294 - -	$\bar{2}$·4683473
Prod. ·1857618 - -	$\bar{1}$·2689564

Here the 2 to carry cancels the $\bar{2}$, and there remains the $\bar{1}$ to set down.

II. *Division by Logarithms.*

From the logarithm of the dividend subtract the logarithm of the divisor, the remainder is a logarithm whose corresponding number will be the quotient required.

But first observe to change the sign of the index of the logarithm of the divisor, viz. from negative to affirmative, or from affirmative to negative; then take the sum of the indices if they be of the same kind, or their difference when of different signs, with the sign of the greater, for the index to the logarithm of the quotient.

And when 1 is borrowed in the left-hand place of the decimal part of the logarithm, add it to the index of the logarithm of the divisor when that index is affirmative, but subtract it when negative; then let the index thus found be changed, and worked with as before.

Ex. 1. To divide 24163 by 4567.

Divid. 24163 its log.	4·3831509
Divis. 4567 - -	3·6596310
Quot, 5·290782 -	0·7235199

Ex. 2. To divide 37·149 by 523·76.

Divid. 37·149 its log.	1·5699471
Divis. 523·76 - -	2·7191323
Quot. ·07092752 -	2·8508148

Ex. 3. To divide ·06314 by ·007241.

Divid. ·06314 its log.	$\bar{2}$·8003046
Divis. ·007241 -	$\bar{3}$·8597985
Quot. 8·719792 -	0·9405061

Here 1 carried from the decimals to the $\bar{3}$ makes it become $\bar{2}$, which taken from the other $\bar{2}$, leaves 0 remaining.

Ex. 4. To divide ·7438 by 12·9476.

Divid. ·7438 its log.	$\bar{1}$·8714562
Divis. 12·9476 -	1·1121893
Quot. ·05744694 -	2·7592669

Here the $\bar{1}$ taken from the $\bar{1}$ makes it become $\bar{2}$ to set down.

III. *The Rule of Three, or Proportion.*

Add the logarithms of the 2d and 3d terms together, and from their sum subtract the logarithm of the 1st, by the foregoing rules; the remainder will be the logarithm of the 4th term required.

Or in any compound proportion whatever, add together the logarithms of all the terms that are to be multiplied, and from that sum take the sum of the others; the remainder will be the logarithm of the term sought.

But instead of subtracting any logarithm, we may add its complement, and the result will be the same. By the complement is meant the logarithm of the reciprocal of the given number, or the remainder by taking the given logarithm from 0, or from 10, changing the radix from 0 to 10; the easiest method of doing which, is to begin at the left hand, and subtract each figure from 9, except the last significant figure on the right-hand, which must be subtracted from 10. But when the index is negative, add it to 9, and subtract the rest as before. And for every complement that is added, subtract 10 from the last sum of the indices.

Ex. 1. To find a 4th proportional to 72·34, and 2·519, and 357·4862.

As 72·34 - comp. log.	8·1406215
To 2·519 - -	0·4012282
So 357·4862 - -	2·5532592
To 12·44827 - -	1·0951089

Ex. 2. To find a 3d proportional to 12·796 and 3·24718.

As 12·796 - comp. log.	8·8929258
To 3·24718 - -	0·5115064
So 3·24718 - -	0·5115064
To ·8240216 - -	$\bar{1}$·9159386

Ex. 3. To find a number in proportion to ·379145 as ·85132 is to ·c649

As ·0649 - comp. log.	11·1877553
To ·85132 - -	1·9300928
So ·379145 - -	$\bar{1}$·5788054
To 4·973401 - - -	0·6966535

Ex. 4. If the interest of 100l. for a year or 365 days be 4·5l. what will be the interest of 279·25l. for 274 days.

As $\left\{\begin{matrix}100\\365\end{matrix}\right\}$ comp. log.	$\left\{\begin{matrix}8·0000000\\7·4377071\end{matrix}\right.$
To $\left\{\begin{matrix}279·25\\274\end{matrix}\right.$ - -	$\left\{\begin{matrix}2·4459932\\2·4377506\end{matrix}\right.$
So 4·5 - -	0·6532125
To 9·433296 - -	0·9746634

IV. *Invo-*

IV. *Involution, or raiſing of Powers.*

Multiply the logarithm of the number given by the propoſed index of the power, and the product will be the logarithm of the power ſought.

Note, In multiplying a logarithm with a negative index by any affirmative number, the product will be negative.—But what is to be carried from the decimal part of the logarithm will be affirmative.—Therefore the difference will be the index of the product; and is to be accounted of the ſame kind with the greater.

Ex. 1. To find the 2d power of 2·5791.

Root 2·5791 its log. 0·4114682
index - - - - 2
Power 6·651756 - 0·8229364

Ex. 2. To find the cube of 3·07146.

Root 3·07146 its log. 0·4873449
index - - - 3
Power 28·97575 - 1·4620347

Ex. 3. To find the 4th power of ·9163,

Root ·09163 its log. $\bar{2}$·9620377
index - - - 4
Power ·000070493 8-$\bar{5}$·8481508

Here 4 times the negative index being $\bar{8}$, and 3 to carry, the difference $\bar{5}$ is the index of the product.

Ex. 4. To find the 365th power of 1·0045.

Root 1·0045 its log. 0·0019499
index - - 365
97495
116994
58497
Power 5·148888 - 0·7117135

V. *Evolution, or Extraction of Roots.*

Divide the logarithm of the power or given number, by its index, and the quotient will be the logarithm of the root required.

Note, When the index of the logarithm is negative, and the diviſor is not exactly contained in it without a remainder, increaſe it by ſuch a number as will make it exactly diviſible; and carry the units borrowed, as ſo many tens, to the left-hand place of the decimal part of the logarithm; then divide the reſults by the index of the root.

Ex.

Ex. 1. To find the ſquare root of 365.

Power 365 - - 2)2·5622929
Root 19·10498 - - 1·2811465

Ex. 2. To find the cube root of 12345.

Power 12345 - - 3)4·0914911
Root 23.11162 - - 1·3638304

Ex. 3. To find the 10th root of 2.

Power 2 - - 10)0·3010300
Root 1·071773 - - 0·0301030

Ex. 4. To find the 365th root of 1·045.

Power 1·045 - - 365)0·0191163
Root 1·000121 - - 0·0000524

Ex. 5. To find the ſquare root of ·093.

Power ·093 - - 2)$\bar{2}$·9684829
Root ·304959 - - $\bar{1}$·4842415

Here the diviſor 2 is contained exactly once in $\bar{2}$ the negative index, therefore the index of the quotient is $\bar{1}$.

Ex. 6. To find the cube root of ·00048.

Power - - - 3)$\bar{4}$·6812412
Root·07829735 - - $\bar{2}$·8937471

Here the diviſor 3 not being exactly contained in $\bar{4}$, augment it by 2, to make it become $\bar{6}$, in which the diviſor is contained juſt $\bar{2}$ times; and the 2 borrowed being carried to the other figures 6 &c, makes 2·6812412, which divided by 3 gives ·8937471.

OF THE TABLES FOR LOGARITHMS TO TWENTY PLACES.

THESE are tables 2d, 3d, and 4th, beginning at page 187. Of theſe, table 2 contains all numbers from 1 to 1000, and all uneven numbers from 1000 to 1161; with their logarithms to twenty places: table 3 contains all numbers from 101000 to 101139, with their logarithms to twenty places, and the 1ſt, 2d, and 3d differences of thoſe logarithms: and table 4 contains all logarithms regularly from 00001 to 00139, with their correſponding natural numbers to twenty places, as alſo the 1ſt, 2d, and 3d differences of thoſe numbers. And by means of them may be found the logarithm to any other number, and the number to any other logarithm, to twenty places of figures.

(I.) *To find the Logarithms to given Numbers.*

CASE 1. If the given number *b* be found in any of theſe three tables; then its logarithm B is in the line even with it.

CASE 2. If *b* is known to be the product or quotient of numbers found in theſe tables; then B is the ſum or difference of the logarithms of thoſe numbers.

CASE

CASE 3. If a', the first six significant figures of a given number b', be found in table 3; let a' be an integer, A′ its logarithm; δ the remaining figures of b'; x the complement of δ to a' or 1; D′, D″, D‴, the 1st, 2d, 3d differences of the logarithms in the same line with A′; $f = \frac{1}{3} D''' \times \overline{x+1} + D''$; Then B′ the logarithm of the number b' will be

$D' \times \delta + A'$ - - to 12
$\frac{1}{2} x D'' + D' \times \delta + A'$ - - to 17 } places of figures nearly.
$\frac{1}{2} x f + D' \times \delta + A'$ - - to 20

Ex. 1. Given the number $b' = 0{\cdot}01010,26227,6351$, to find B′ its logarithm nearly to twelve places.

Here $a' = 101026$. A′ = 00443,31579,747
$\delta = 0{\cdot}2276351$ $\delta D'$ - - - - + 9785,618—
$D' = 429881746$ B′ = $\bar{2}{\cdot}00443,41365,365$—

Ex. 2. Given $b' = 0{\cdot}01010,26227,63509,626$, to find B′ its log. nearly to 17 places. Here $a' = 101026$.

$\delta = 0{\cdot}22763,509626$; $x = 0{\cdot}772365$; $D' = 42988,174579$; $D'' = 425510$.

Now $\frac{1}{2} x D''$ - - - - 16432,45
D′ - - - 42988,17457,86
$\frac{1}{2} x D'' + D'$ - - - 42988,33890,31
$\frac{1}{2} x D'' + D' \times \delta$ - - - 9785,65466,42
A′ - 0 0443,31579,74695,33

And $\overline{\frac{1}{2} x D'' + D' \times \delta + A'}$, or B′ $\bar{2}{\cdot}00443,41365,40161,75$

Ex. 3. Given $b' = 0{\cdot}01010,26227,63509,62573,17345$, to find B′ its log. nearly to 20 places. $a' = 101026$.

$\delta = 0{\cdot}22763,50962,573173$; $x = 0{\cdot}77236,490374$; $x+1 = 1{\cdot}772365$;
$D' = 42988.17457,86301$; $D'' = 42550,96343$; $D''' = 84236$.

Now $\frac{1}{3} D''' \times x + 1$ - - - - 49766
D″ - - - 42550,96343
f - - - - - 42551,46109
$\frac{1}{2} x f$ - - - - - - 16432,62757
D′ - - - 42988,17457,86301
$\frac{1}{2} x f + D'$ - - - 42988,33890,49058
$\frac{1}{2} x f + D' \times \delta$ - - - 9785,65466,45604
A′ - - 00443,31579,74695,32791

And B′ - - - 2,00443,41365,40161,78395

CASE 4. If the number b come under none of the preceding cases: put a for the first five figures of b; n for 101, the least, or some one, of the numbers in table 3; then $\frac{a}{n}$ or $\frac{n}{a} = a$ is to be had in table 2, with A its logarithm; let $b' = \frac{b}{a}$ or ba, and a' the first six significant figures of b' (found in table 3) be an integer,

ger, and A' its logarithm; put δ for the remaining figures of b'; x the complement of δ to d'; D', D'', D''', the 1st, 2d, 3d, differences of the logarithms in the same line with A'; $f = \frac{1}{3} D''' \times \overline{x+1} + D''$. Then B the logarithm of the number b will be

$$\left.\begin{array}{l} D' \times \delta + A' \pm A = B' \pm A \text{ to } 12 \\ \frac{1}{2} x D'' + D' \times \delta + A' \pm A = B' \pm A \text{ to } 17 \\ \frac{1}{2} x f + D' \times \delta + A' \pm A = B' \pm A \text{ to } 20 \end{array}\right\} \text{places of figures nearly.}$$

Ex. Given $b = 3{\cdot}14159,26535,89793,23846,26434$, to find B to twenty places.

Here $a = 31415$. Let $a = \frac{a}{n} = 311$.

Then $b' = \frac{b}{a} = 0\ 01010,15840,95144,02970,57$; $a' = 101015$.

$\delta = 0{\cdot}84095,14402,97057$; $x = 0{\cdot}15904,85597$; $x+1 = 1{\cdot}15905$;
$D' = 42992,85574,06337$; $D'' = 42560,23099$; $D''' = 84263$.

Now $\frac{1}{3} D''' \times \overline{x+1}$	32555
D''	42560,23099
f	42560,55654
$\frac{1}{2} x f$	3384,59761
D'	42992,85574,06337
$\frac{1}{2} xf + D'$	42992,88958,66098
$\frac{1}{2} xf + D' \times \delta$	36154,93242,03919
A'	00438,58681,74054,30961
A	49276,03890,26837,50555
And B	0·49714,98726,94133,85435

Or, let $a = \frac{n}{a} = 3{\cdot}216 = 0{\cdot}536 \times 6$.

Then $b' = ba = 10{\cdot}10336,19739,44775,0549$; $a' = 101033$.
$\delta = 0{\cdot}61973,94477,50549$; $x = 0{\cdot}38026,055225$; $x+1 = 1{\cdot}38026$;
$D' = 42985,19618,80760$; $D'' = 42545,06747$; $D''' = 84219$.

Now $\frac{1}{3} D''' \times \overline{x+1}$	38748
D''	42545,06747
f	42545,45495
$\frac{1}{2} xf$	8089,17910
D'	42985,19618,80760
$\frac{1}{2} xf + D'$	42985,27707,98670
$\frac{1}{2} xf + D' \times \delta$	26639,67187,88811
A'	00446,32488,03359,61854
B'	1·00446,59127,70547,50665
A	0·50731,60400,76413,65230
$B = B' - A$	0·49714,98726,94133,85435

(II.) *To find the Numbers to given Logarithms.*

Case 1. When the logarithm B is found in any of these three tables: then its number b is in the line even with it.

CASE 2. If the first five figures (omitting the index) of a given logarithm B′, be between 00432 and 00492: take them as an integer, and put A′ and C′ for the logarithms, in table 3, next less and greater than B′, a' and c' their numbers; let D′ (= C′ − A′) and D″ be the 1st and 2d differences in the line with A′; Δ = B′ − A′; $d' = (c' - a' =)$ 1; $X = \frac{D' - \Delta}{D'}$; $\delta = \frac{\Delta}{D' + \frac{1}{2} X D''}$: then $b' = a' + \delta$, nearly true to 17 places of figures.

Ex. Given the logarithm B′ - - = 5,00446,59127,70547,807 to find b' its number.

A′ = 5,00446,32488,03359,619

$a' = 101033$

δ - - - 0·61973,944776

$b' = 101033{\cdot}61973,944776$

Δ = 0·26639,67187,888

D′ = 0·42985,19618,808

D′ − Δ = 0·16345,52430,920

X = 0·38026

D″ = 0·00000,42545

$\frac{1}{2}$ X D″ = 0·00000,08089,1

D′ + $\frac{1}{2}$ X D″ = 0·42985,27707,9

But when any other logarithm B is given, subduct ·004321 from the first six figures of B; call the remainder R, and let A be the logarithm in table 2, next less than R, or next greater than the complement of R, and a its number: then B′ = B − A, or B′ = B + A, will be within the limits of table 3, and b' will be found as in the preceding example; and if B′ = B − A, then $b = ab'$; or if B′ = B + A, then $b = \frac{b'}{a}$.

CASE 3. If A′, the first five figures (omitting the index) of a given logarithm B′, be found in table 4: let a' be its number; and put A′ as an integer, and Δ the remaining figures of B′, and X the complement of Δ to D′; d', d'', d''', the 1st, 2d, 3d differences of the numbers in the same line with a'; $f = d'' - \frac{1}{3} d''' \times \overline{X + 1}$: then the number b', whose logarithm is B′, will be

$d'' \times \Delta + a'$ - - - to 12

$\overline{d'' - \frac{1}{2} X d''} \times \Delta + a'$ - - - to 17 } places of figures nearly.

$\overline{d'' - Xf} \times \Delta + a'$ - - - to 20 }

Ex. Given the logarithm B′ = 0·00006,93311,37711,69929, to find b' its number to 20 places. Here A′ = 00006.

Δ = 0·93311,37711,69929; X = 0·06688,622883; X + 1 = 1·066886;

a' = 23029,29742,21293; d'' = 53027,52746; d''' = 1,22100.

Now $\frac{1}{3} d''' \times \overline{X+1}$	43422
d''	53027,52746
f	53027,09324
$\frac{1}{2} X f$	1773,39115
d'	23029,29742,21293
$d' - \frac{1}{2} X f$	23029,27968,82178
$\overline{d' - \frac{1}{2} X f} \times \Delta$	21488,93801,72000
a'	10001,38164,64943,57474
And b'	1·00015,96535,87452,9474

Case 4. If the logarithm B come under none of the preceding cases. Put A for the logarithm in table 2, next less than B, or next greater than the complement of B, and a its number; let $B' = B - A$, or $B' = B + A$; and A', the first five figures of B', may be had in table 4, with a' its number; put A' as an integer, and let Δ be the remaining figures of B'; X the complement of Δ to D'; d', d'', d''', the 1st, 2d, 3d differences of the numbers in the same line with a'; $f = d'' - \frac{1}{3} d''' \times \overline{X+1}$: then the number b', whose logarithm is B', will be

$$\left.\begin{array}{l} \overline{d' \times \Delta + a'} \times a = ab' \text{ to 11} \\ \overline{d' - \frac{1}{2} X d''} \times \Delta + a' \times a = ab' \text{ to 16} \\ \overline{d' - \frac{1}{2} X f} \times \Delta + a' \times a = ab' \text{ to 19} \end{array}\right\} \text{places of figures nearly.}$$

Ex. Given $B = \overline{4}\cdot46372,61172,07184,15204$, to find b its number.

Let $A = 1\cdot46239,79978,98956,08733$. $a = 29$.

$B' = B - A = \overline{5}\cdot00132,81193,08228,06471$. $A' = 00132$.

$\Delta = 0\cdot81193,08228,06471$; $X = 0\cdot18806,91772$; $X+1 = 1\cdot18807$;

$d' = 23096,20835,34589$; $d'' = 53181,59733$; $d''' = 1\cdot22457$.

Now $\frac{1}{3} d''' \times \overline{X+1}$	48496
d''	53181,59733
f	53181,11237
$\frac{1}{2} X f$	5000,86402
d'	23096,20835,34589
$d' - \frac{1}{2} X f$	23096,15834,48187
$\overline{d' - \frac{1}{2} X f} \times \Delta$	18752,45284,85771
a'	10030,44036,01963,96855
b'	10030,62788,50248,82626
$b = ab'$	0·00029,08882,08665,72159,6154

Or,

Or, given $B = \overline{4}\cdot46372,61172,07184,15204$, to find b.
Let $A = 2\cdot53655,84425,71530,11205$. $a = 344$.
$B' = B + A = \overline{1}\cdot00028,45597,78714,26409$. $A' = \cdot00028$.

$\Delta = 0\cdot45597,78714,26409$; $X = 0\cdot54402,21286$; $\overline{X+1} = 1\cdot54402$;
$d'' = 23040,96629,91521$; $d''' = 53054,39634$; $d^{IV} = 1\cdot22163$.

Now $\frac{1}{3} d''' \times \overline{X+1}$ - - -	62874
d''' - - - -	53054,39634
f - - - - -	53053,76760
$\frac{1}{2} X f$ - - -	14431,21179
d'' - - - -	23040,96629,91521
$d'' - \frac{1}{2} X f$ - - - -	23040,82198,70342
$d' - \frac{1}{2} X f \times \Delta$ - - -	10506,10496,55627
d' -	10006,44931,70511,67281
b' - - -	10006,55437,81008,22908
$b = \frac{b'}{a}$ - -	0·00029,08882,08665,72159,616

OF THE TABLES FOR LOGARITHMS TO SIXTY-ONE PLACES.

Theſe are tables 5 and 6, from page 204 to page 208; the former containing the natural numbers in regular order from 1 to 100, and after that all the primes up to 1100, with their correſponding logarithms to ſixty-one places of figures; and the latter in page 208 contains all numbers in order from 999980 to 1000020, with their logarithms to ſixty-one places, as alſo the 1ſt, 2d, 3d, and 4th differences of theſe logarithms. And the uſe of theſe tables, in finding the logarithm to any number, or the number to any logarithm, each to ſixty-one places of figures, will be as follows.

1. *Any Number being given, to find its Logarithm to* 61 *Places of Figures.*

IF the given number be in either of the tables, its logarithm is found in the line even with it.

If the given number is the product or quotient of any two or more numbers found in the tables, the sum or difference of their logarithms is the logarithm of the given number.

If the given number is not in either table, or is not the product or quotient of any there, then divide 999998000000 by the first six figures of the given number, the quotient, if composed by the multiplication, or division, or both, of any numbers in table 5, or the nearest number to the quotient so composed, will for the most part be a factor for multiplying the given number to make the first six or seven figures of the product, with the residue as a decimal, near one of the numbers in table 6 whose logarithm is there given; and the logarithm of the fraction made by the product and that number (found by the series in page 105) added, if the product be the greater, or subtracted, if the less, will give the logarithm of the product; then subtracting the logarithm of the factor, the remainder is the logarithm of the given number: but if no such product can be had, then seek for some product composed of numbers in the tables, as shall have the first six, seven, or more figures thereof, the same as those of the given number, or of some product of it made by one or more of the said numbers, whereby its logarithm will be found as before.

Let the logarithm of (π) 3·14159,26535,89793,23846,26433,83279,50288,41971,69399,37510,58209,74944,59230 (the circumference of a circle whose diameter is 1, or the measure of the arc of 180 deg. when the radius is 1) be fought, and thereby the logarithm of (M) the measure of the arc of 1 minute.

999998000000 divided by 314159 quotes 318310 nearly, which (being composed of 229 × 1390) is a fit multiplier for the number 3·14159 &c. whose product 1000000·35756,41670,85735,04401,53316,98563,06880,09915,15089,93387,45346,13 &c suits very well, being nearest 1000000 in table 6. But if no such product could have been found, or that it is known, the product of some others (as 313 × 271 divided by 27) will suit nearer, and shorten the operation, instead of the multiplier 318310, take 27, then the product is 84·82300,16469,24417,43849,13713,48546,57787,33235,73783,12785,71663,23503,9921 $= b$, and the first five figures 84·823 (3·13 × 27·1) $= a$.

Let $\frac{b-a}{b+a} = \frac{x}{z}$ . . . . . $\frac{0{\cdot}00000,16469,24417,43849,13713,48546,57787,33235,73783,12785,71663,23504}{169{\cdot}64600,16469,24417,43849,13713,48546,57787,33235,73783,12785,71663,23504} = A.$

A	0·00000,00097,08006,09180,37507,16877,07959,99442,15465,88288,82125,59471,23822
$\frac{1}{3}A^3$	3,04978,24842,80129,87165,70018,85854,85688,49896
$\frac{1}{5}A^5$	17245,67496,58350,23735,18262
$\frac{1}{7}A^7$	1160,94659
Natural logarithm of $\frac{b}{a}$ . . .	0·00000,00097,08006,09180,37510,21855,32802,79572,19877,25804,26330,70055,86639

This multiplied by 0·86858,89638 &c. gives Briggs's logarithm of $\frac{b}{a}$.

Briggs's

Briggs's logarithm of $\frac{b}{a}$	0·00000,00084,32266,95190,70452,98319,82138,06447,38123,25534,00216,080009

Note, The index of this laſt logarithm being — 4, its complement (6) is put down, that it may be like thoſe of the log. ſines, tangents, &c.

2. *Any Logarithm being given, to find its correſponding Number to* 61 *Places of Figures.*

If the given logarithm is in either of the tables, its number is found in the ſame line prefixed.

If the given logarithm is not in the tables, then find the firſt ſeven or eight figures of the number by any other table of logarithms; and if ſix or all of them be the component of numbers in theſe tables, it will ſuit very well; but if not, the neareſt number thereto, either greater or leſs, compoſed of theſe numbers will do; for the logarithm of ſuch component is had in theſe tables; then the number anſwering to the difference of the two logarithms (found by Dr. Halley's rule in page 106, for finding the number from the log. given) multiplied by that component, gives the number ſought.

Let the example be to find the number repreſented by $\overline{1\cdot06}\left|^{\frac{1}{365}}\right.$, or the amount of one pound for one day, at the rate of 6*l. per cent. per ann.* compound intereſt.

The log. of 1·06 (= log. of 0·53+log. of 2)	0·02530,58652,64770,24084,67311,86351,74961,94636,92282,75704,63219,045305
$\frac{1}{365}$ of log. of 1·06 = L	0·00006,93311,37711,69928,99910,44346,16917,70396,26554,19933,43734,846699

To which the neareſt number of ſix figures (found in the firſt or general table) anſwering, though greater, compoſed of numbers in table 5, is 1·00016 (=7·6×0·47×0·28) = b.

Log. of b (=log. of 7·6+log. of 0·47+log. of 0·28)	=0·00006,94815,58728,03751,77247,12696,73825,86672,64357,99684,49976,894931
From which ſubtract L	0·00006,93311,37711,69928,99910,44346,16917,70396,26554,19933,43734,846699
There will remain l	0·00000,01504,21016,33822,77336,68350,56908,16276,37803,79751,06242,048232

This multiplied by m = 2·30258 &c, produces $m\,l$ = 0·00000,03463 &c = A.

A	0·00000,03463,57189,89341,69713,22305,54835,82225,32861,41751,01028,013306

$\frac{1}{40320}A^8$	51366
Sum of the affirmative parts	1·00000,00000,00059,98165,14954,32851,32427,03249,69228,59145,19535,361483
A	0·00000,03463,57189,89341,69713,22305,54835,82225,32861,41751,01028,013306
$\frac{2}{6}A^3$	69250,25419,04139,54832,19404,56566,02823,144488
$\frac{1}{120}A^5$	4,15374,46128,19506,74801,808389
$\frac{1}{5040}A^7$	11,86421,246511
Sum of the negative parts	0·00000,03463,57189,89342,38963,47724,58979,52431,98394,17835,65074,212694
Reſult of the ſeries	0·99999,96536,42870,08822,75990,85126,73447,50817,70834,41309,54461,148789

Which multiplied by 1·00016 gives $(\overline{1\cdot06}|^{\frac{1}{365}})$. 1·00015,96535,87452,94744,17155,00980,35475,25977,83917,74660,15413,862573

If it was required to find the number repreſented by $\overline{1\cdot05}|^{\frac{1}{365}}$, or the amount of one pound for one day at the rate of 5*l. per cent. per ann.* compound intereſt.

The log. of 1·05 (= log. of 0·21 + log. of 5) = 0·02118,92990,69938 &c; and $\frac{1}{365}$ thereof is 0·00005,80528,74164 &c = L, to which the neareſt number of eight figures anſwering, but leſs, compoſed of numbers in table 5, is 1·0001334 (= 1·51 × 0·83 × 0·42 × 1·9) = a; this will converge ſwifter than the preceding. Such expedients may be found for moſt numbers that can be propoſed.

Note, Of any number produced between the numbers in table 6, the logarithm may be moſt eaſily had to 30 places, by the ſeveral differences annexed.

Of

OF THE TABLE OF HYPERBOLIC LOGARITHMS.

This is table 7, in pages 209 - - - 212, which contain the ſeries of numbers 1·01, 1·02, 1·03, &c to 10·00, with their hyperbolic logarithms to ſeven places of figures. They are ſo called becauſe they ſquare the aſymptotic ſpaces of the right-angled hyperbola; and they are very uſeful in finding fluents, and the ſums of infinite ſeries. The table, as well as the following rules, were firſt given at the end of Simpſon's fluxions; but they were rendered much more correct in the French edition of Gardiner's tables, printed at Avignon in 1770, being very incorrect in the laſt figure in Simpſon's book. But both thoſe books are very erroneous in the example for finding logarithms by the table.

1. *When the given Number is between* 1 *and* 10.

From the given number ſubtract the next leſs tabular number, divide the remainder by the ſaid tabular number increaſed by half the remainder; add the quotient to the logarithm of the ſaid tabular number, and the ſum will be the logarithm of the number propoſed.

Ex. To find the hyperbolic logarithm of 3·45678. Here the next leſs number is 3·45, and its logarithm 1·2383742, the remainder or dividend ·00678, its half 339, which joined to the tabular number 3·45 gives the diviſor: the quotient ·0019633 added to the tabular logarithm 1·2383742, gives 1·2403375 the required logarithm of 3·45678.

3·45339)·00678(·0019633
1·2383742
log. 1·2403375

2. *When the given Number exceeds* 10.

Find the logarithm of the number as above, ſuppoſing all the figures after the firſt to be decimals; then to that logarithm add 2·3025851, or 4·6051702, or 6·9077553, &c, according as the given number contains 2, or 3, or 4, &c, places of integers, That is, add 2·302585092994 multiplied by the index of the power of 10, by which the given number was divided to bring it to one integer, or within the limits of the table.

Ex. To find the hyperbolic logarithm of 345·678. This number divided by 100 or 10^2, to bring it within the limits of the table, or removing the decimal point two places, gives 3·45678, the logarithm of which as above found is 1·2403375, to which adding 4·6051702 the hyperbolic logarithm of 100, the ſum is 5·8455077 the hyperbolic logarithm required of 345·678.

1·2403375
4·6051702
5·8455077

Note,

Note, The hyperbolic logarithm of any number may be alſo found from Briggs's logarithms, viz. multiplying Briggs's logarithm of the ſame number by the hyperbolic logarithm of 10, viz.

Multiplying by - - 2·30258,50929,94045,68401,79914,
Or dividing by its reciprocal ·43429,44819,03251,82765,11289.

OF THE LOGISTIC LOGARITHMS.

Theſe are in table 8 pages 213 - - - 217, which contain the logiſtic logarithm of every ſecond as far as the firſt 80′ or 4800″.

The logiſtic logarithm of any number of ſeconds, is the difference between the logarithm of 3600″ and the logarithm of that number of ſeconds.

The chief uſe of the table of logiſtic logarithms, is for the ready computing a proportional part in minutes and ſeconds, when two terms of the proportion are minutes and ſeconds, hours and minutes, or other numbers.

When two terms of the proportion are common numbers, their common logarithms may be uſed inſtead of their logiſtic logarithms, putting the logarithm where its complement ſhould be, and the contrary.

1. *To find the Logiſtic Logarithm of any Number of Minutes and Seconds, within the Limits of the Table.*

At the top of the table find the minutes, and in the ſame column, even with the ſeconds on the left-hand ſide, is the logiſtic logarithm.

Note, When hours are made any terms of the proportion, they are to be taken as if they were minutes, and the minutes of an hour as if they were ſeconds.

2. *To find the Logiſtic Logarithm of any Number not exceeding* 4800.

In the 2d row next the top of the table find the number next leſs than that given, and in the ſame column, even with the difference on the left-hand ſide, is found the logiſtic logarithm.

When two given terms of the proportion are common numbers, one or both greater than 4800, take their halves, thirds, &c, inſtead of them. But when only one of the given terms is a common number, and that greater than 4800, take its half, third, &c, and multiply the 4th term by 2, 3, &c.

The logiſtic logarithms in this table are all affirmative, as well above as below 60′; but the index of thoſe above 60′ is — 1; below 60′ down to 6′, the index is 0; and below 6′, the indices (being either 1, 2, or 3) are expreſſed in the table.

EXAMPLES.

EXAMPLES.

As 60′		lo. log.
To 46′ 12″	.	0·1135
So 8 7	.	0·8688
To 6 15	.	0·9823
As 46′ 12″	. co.	$\bar{1}$·8865
To 60 0	.	0·0000
So 6 15	.	0·9823
To 8 7	.	0·8688
As 60′	. co.	0·0000
To 4721	.	$\bar{1}$·8823
So 37′ 28″	.	0·2045
To 2948	.	0·0868
As 4721	. co.	0·1177
To 60′ 0″	.	0·0000
So 2948	.	0·0868
To 37′ 28″	.	0·2045

As 60′		lo. log.
To 78′ 27″	.	$\bar{1}$·8836
So 13 53	.	0·6357
To 18 9	.	0·5193
As 78′ 27″	. co.	0·1164
To 60 0	.	0·0000
So 18 9	.	0·5193
To 13 53	.	0·6357
As 24^h	. co.	$\bar{1}$·6021
To 46′ 11″	.	0·1137
So 8^h 7′	.	0·8688
To 15′ 37″	.	0·5846
As 46′ 11″	. co.	$\bar{1}$·8863
To 24^h	.	0·3979
So 15′ 37″	.	0·5846
To 8^h 7′	.	0·8688

As 60′		lo. log.
To 1531	.	0·3713
So 40′ 12″	.	0·1135
To 1179	.	0·4848
As 40′ 12″	. co.	$\bar{1}$·8865
To 1179	.	0·4848
So 60′ 0″	.	0·0000
To 1531	.	0·3713
As 24^h	. co.	$\bar{1}$·6021
To 76′ 34″	.	$\bar{1}$·8941
So 13^h 53′	.	0·6357
To 44′ 17″	.	0·1319
As 76′ 34″	. co.	0·1059
To 24^h	.	0·3979
So 44′ 17″	.	0·1319
To 13^h 53′	.	0·6357

The logiſtic logarithms may conveniently be uſed in trigonometrical operations, when two of the terms are ſmall arcs, with the logarithmic ſines or tangents of other arcs: obſerving, that inſtead of the logarithmic ſine or tangent, to take the complement of their logiſtic logarithm; and the contrary.

But this may be as readily and more naturally done by the logarithmic ſines and tangents themſelves of ſuch ſmall arcs, as taken from the next following table of ſines and tangents for every ſecond of the firſt 2° or 120′.

OF THE LOGARITHMIC SINES AND TANGENTS TO EVERY SECOND.

Table 9, pages 218 - - - 247, contains the log. ſines and tangents for every ſingle ſecond of the firſt 2 degrees of the quadrant; the ſines being placed on the left-hand pages, and tangents on the right. The degrees and minutes are placed at the top of the columns, and the ſeconds on the left-hand ſide, of each page, the logarithmic ſine or tangent being found in the common angle of meeting. So of 1° 52′ 54″ the log. ſine is 8·5163420, and the log. tangent 8·5165762.

The ſame numbers are alſo the coſines and cotangents of the laſt 2 degrees of the quadrant, thoſe degrees with their minutes being placed at the bottom of the columns, and their ſeconds aſcending

on the right-hand ſide of the pages. So the coſine of 88° 7′ 6″ is 8·5163420, and its cotangent 8·5165762.

When it is required to find the ſine or tangent &c. to 3ds &c. or any other fractional part of a ſecond, ſubtract the tabular ſine or tangent of the compleat ſeconds from the next to it in the table, and take the like proportional part of the difference; which part added to, or taken from, the ſaid tabular ſine or tangent, according as it is increaſing or decreaſing, will give the ſine or tangent required.

Ex. To find the log. ſine of 1° 52′ 54″ 25‴ or 1° 52′ 54″ $\frac{25}{60}$ or $\frac{5}{12}$.

Here the ſine of 1° 52′ 54″ taken from the next leaves 641, which multiplied by 5 and divided by 12, or multiplied by 25 and divided by 60, gives 267 the pro. part; this added to the firſt ſine gives that which was required.

1° 52′ 54″	ſine 8·5163420
1 52 55 . . .	8·5164061
	dif. 641
	5
	12)3205
	pro. part 267
1° 52′ 54″ . .	8·5163420
1° 52′ 54″ 25‴	8·5163687

On the contrary, if a ſine or tangent be given, to find the correſponding arc; take the difference between it and the next leſs tabular number, and the difference between the next leſs and greater tabular numbers, ſo ſhall the leſs difference be the numerator, and the greater the denominator, of the fractional part to be added to the arc of the leſs tabular number; which fraction may alſo, if required, be either turned into a decimal, or into 3ds &c. by multiplying the numerator by 60 and dividing by the denominator.

Ex. To find the arc whoſe ſine is 8·5163900.

Finding the number is between the ſines of 1° 52′ 55″ and 1° 52′ 54″, take the differences between the ſines as in the margin, and the differences give $\frac{480}{641}$ for the fraction of a ſecond, or $\frac{3}{4}$ nearly, which abbreviates to $\frac{3''}{4} = 45'''$; and therefore the arc ſought is 1° 52′ 54″ 45‴.

1° 52′ 55″ - - -	8·5164061
1 52 54 - - - -	8·5163420
1 52 54 45‴ -	8·5163900
	diff. - - 480
	diff. - - 641

Where the 1ſt differences of the ſines and tangents alter much, as near the beginning of the table, the 2d, 3d, &c. differences may be taken in, and then the logarithmic ſine or tangent will be expreſſed by this ſeries, viz.

$$Q = A + xD' + x.\frac{x-1}{2}D'' + x.\frac{x-1}{2}.\frac{x-2}{3}D''' \text{ &c, or nearly } A + \overline{D' - \tfrac{1}{2}D''}.x;$$

where A is the next leſs tabular logarithm, D′, D″, D‴, &c. the 1ſt, 2d, 3d, &c. differences of the tabular logarithms, and x the fractional part of the arc over the compleat ſeconds.

Ex.

Ex. To find the log. tangent of $5'\ 1''\ 12'''\ 24^{iv}$ or $5'.1''\frac{62}{100}$ or $5'\ 1''.206$.

	Tang.	D′	D″
5′ 0″	7·1626964	14453	-49
5 1	7·1641417	14404	-47
5 2	7·1655821	14357	
5 3	7·1670178		

Here A = 7·1641417; $x = \frac{62}{100}$; D′ = 14404; and the mean 2d diff. D″ = — 48. Hence

A	7·1641417
x D′	2977
$x.\frac{x-1}{2}$ D″	4

Therefore the tangent of $5'\ 1''\ 12'''\ 24''$ = 7·1644398

And on the other hand, when the ſine or tangent is given, and falls near the beginning of the table, from the ſame ſeries we may find x the fractional part of a ſecond. For ſuppoſe it be required to find the arc whoſe tangent is 7·1644398. This falling between the tangents of 5′ 1″ and 5′ 2″, take the differences &c. as above, and the ſeries gives $7{\cdot}1644398 = 7{\cdot}1641417 + x\,D' + x.\frac{x-1}{2}D''$, or $2981 = 14404x - 24.\overline{x^2 - x}$, or $-24x^2 + 14428x = 2981$; which gives $x = {\cdot}2067''$ nearly $= 12'''\ 24^{iv}$. Therefore the arc required is $5'\ 1''\ 12'''\ 24''$. Or rather the approximate value $A + D' - \frac{1}{2}D''.x = Q$, gives $x = \frac{Q-A}{D'-\frac{1}{2}D''} = \frac{2981}{14404+24} = \frac{2981}{14424} =$ ·2067, the ſame as before.

OF THE TABLE OF NATURAL AND LOGARITHMIC SINES, TANGENTS, &c.

Table 10, page 248 - - - - 337, contains all the ſines, tangents, ſecants, and verſed ſines, both natural and logarithmic, to every minute of the quadrant, the degrees at top, and minutes deſcending down the left-hand ſide as far as 45°, or the middle of the quadrant, and from thence returning with the degrees at the bottom, and the minutes aſcending by the right-hand ſide to 90°, or the other half of the quadrant, in ſuch ſort that any arc on the one ſide is on the ſame line with its complement on the other ſide; the reſpective ſines, coſines, tangents, cotangents, &c. being on the ſame line with the minutes, and in the columns ſigned with their reſpective names, at top when the degrees are at top, but at the bottom when the degrees are at the bottom. The natural ſines, tangents, &c. are placed all together on the left-hand pages, and the logarithmic ones all together, facing them, on the right-hand pages. Alſo in the naturals there are two columns of common differences, and in the logarithmic 3 columns of common differences, each column of differences being placed between the two columns of numbers having the ſame differences; ſo that theſe differences ſerve for both their right-hand and left-hand adjacent columns: alſo each differential number is ſet oppoſite the ſpace between the numbers whoſe difference it is. The numbers on the ſame line in thoſe columns having ſuch common differences, are mutually complements

of each other; ſo that the ſum of the decimal figures of any two ſuch numbers, is always 1 integer, with 0 in each place of decimals.

All this will be evident by inſpecting one page of each ſort, as well as the method of taking out the ſine, &c. to any degrees and compleat minutes. It is however to be obſerved, that in all the log. ſines, tangents, &c. and in ſuch of the natural as have any ſignificant figure for their index or characteriſtic, the indices are expreſſed in the table, and the ſeparating point is placed between the index and the decimal part of the number; but in ſeveral columns of the natural ſines, &c. having 0 for their integer or index, both the index and decimal ſeparating point are omitted: and wherever this is the caſe, it is to be underſtood that all the figures in ſuch columns are decimals, wanting before them only the ſeparating point and index 0.

The ſine, tangent, or ſecant of any arc, has the ſame value, or is expreſſed by the ſame number, as the ſine, tangent, or ſecant of the ſupplement of that arc; for which reaſon the tables are carried only to a quadrant or 90 degrees. So that when an arc is greater than 90°, ſubtract it from 180°, and take the ſine, tang. or ſecant of the remainder, for that of the arc given. But this property does not take place between the verſed ſines of arcs and their ſupplements: and to find the verſed ſine of an arc greater than 90°, proceed thus: in the natural verſed ſines, to radius add the natural coſine, the ſum will be the natural verſed ſine; and in the log. verſed ſines, add 0·3010300 to twice the log. ſine of half the arc, the ſum, abating radius 10·0000000, will be the log. verſed ſine required.

1. *Given any Arc; to find its Sine, Coſine, Tangent, &c.*

Seek the degrees at the top or bottom, and the minutes reſpectively on the left or right, and on the ſame line with theſe is the ſine, &c. each in its proper column, the title being at the top or bottom, according as the degrees are.

But when the given arc contains any parts of a minute, intermediate to thoſe found in the table: take the difference between the tabular ſines, &c. of the given degrees and minutes, and of the minute next greater; then take the proportional part of that difference for the parts of the minute, and add it to the ſine, tangent, ſecant, and verſed ſine, or ſubtract it from the coſine, cotangent, coſecant, or coverſed ſine, of the given degrees and minutes; ſo ſhall the ſum or remainder be the ſine, &c. required.

Note, The proportional part is found thus, as 1′ is to the given intermediate part of a minute, ſo is the whole difference, to the proportional part required; which therefore is found by multiplying the difference by the ſaid intermediate part. Alſo that intermediate part may be expreſſed either by a vulgar fraction, or decimal, or a ſexageſimal in ſeconds, thirds, &c. and the fraction or ſexageſimal

may

may be firſt reduced to a decimal, if it be thought better ſo to do, by dividing the numerator of the fraction by the denominator, or by dividing the ſexageſimal by 60.

EXAMPLES.

1. To find the natural ſine of $1^\circ\ 48''\ 28''\ 12'''$.

In the column of difference between the natural ſines of $1^\circ\ 48'$ and $1^\circ\ 49'$ is the difference 2907; and $28''\ 12'''$ being $= 28{\cdot}2'' = {\cdot}47'$; therefore as $1 : 2907 :: {\cdot}47$: the pro. part $+1366$ to which add fin. $1^\circ\ 48'$ - 0314108 makes fin. of $1^\circ\ 48'\ 28''\ 12'''$ 0315474

2. To find the natural tangent of $8^\circ\ 9'\ 10''\ 24'''$.

$8^\circ\ 10'$ tang. - - 1435084

$12''\ 20'''$: pro.part }
$39^\circ\ 4'$ cotan. - 10·0905978
$39^\circ\ 4'\ 12''\ 20'''$ 10·0905447

The foregoing method of finding the proportional part of the tabular difference, to be added or ſubtracted, by one ſingle proportion, is only true when thoſe differences are nearly equal, and may do for all except for the tangents and ſecants of great arcs near the end of the quadrant in the natural ſines, &c. and in the log. ſines, &c. except the ſines and verſed ſines of ſmall arcs, the tangents of both large and ſmall arcs, and the ſecants of large arcs. And when much accuracy is required, theſe excepted parts may be found by the ſeries uſed in the laſt article, viz. $Q = A + x\,D' + x.\frac{x-1}{2}D'' + x.\frac{x-1}{2}.\frac{x-2}{3}D'''$ &c. or $= A + \overline{D' - \frac{1}{2}D''}\,x$ nearly; where A is the tabular number for the degrees and minutes, D', D'', D''', &c. the 1ſt, 2d, 3d, &c. tabular differences, and x the fractional part over the compleat minutes, &c; at leaſt it may be proper to find the tang. and ſecants of very large arcs from this ſeries; but as to the log. ſines, verſed ſines, and tangents of ſmall arcs, they may alſo be found, perhaps eaſier, from their correſponding natural ones, viz. find the natural ſine, verſed ſine, or tangent of the

the given ſmall arc, and then find the log. of ſuch natural number by the 1ſt or large table of logarithms, which will be the log. ſine, &c. required. And the log. tangent and ſecant of large arcs will be alſo found by taking the difference between 20 and their log. cotangent and coſine reſpectively. And laſtly, the natural tangents and ſecants of large arcs may alſo be found by firſt finding their log. tangent and ſecant, and then finding the correſponding number.

EXAMPLES.

1. To find the log. ſine of 1° 48′ 28″ 12‴.
The natural ſine, found in Ex. 1. above, is ·0315474; and the log. of this is 8·4989636 the log. ſine required.

2. To find the log. vers. of 1° 48′ 28″ 12‴.
1° 48′ nat. vers. - - 0004934
1 : 92 tab. dif. :: ·47′ = 28″ 12‴ : + 43
1° 48′ 28″ 12‴ nat. vers. ·0004977
Its log. 1 48 28 12 log. vers. - 6·6969676

3. To find the log. tang. of 2° 23′ 33″ 36‴.
2° 23′ its nat. tan. - - - 0416210
1 : 2914 tab. dif. :: ·56′ = 33″ 36‴ : + 1632
2° 23′ 33″ 36‴ nat. tan. 0417842
Its log. 2 23 33 36 log. tan. 8·6210121

4. To find the log. tang. of 87° 36′ 26′ 24‴.
Its complement is - - 2 23 33 36
Whoſe log. tang. in Ex. 3. is - 8·6210121
Taken from - - - - - - 20·0000000
Leaves log. tan. 87° 36′ 26″ 24‴ 11·3789879

5. To find the log. ſec. of 88° 11′ 31″ 48‴.
Its complement is - - 1 48 28 12
Its log. ſine in Ex. 1. is - - 8·4989636
Which taken from - - - 20·0000000
Leaves l. ſec. 88° 11′ 31″ 48‴ 11·5010364

6. To find the nat. ſec. of 88° 11′ 31″ 48‴.

		nat. ſec.	D′	D″	D‴
88°	9′	30·976074	281503	5166	
88	10	31·257577	286669	5310	144
88	11	31·544246	291979	5459	149
88	12	31·836225	297438		
88	13	32·133663			

Hence A = 31·544246; D′ = 291979; D″ = 5310; the mean D‴ = 146;

$x = ·53' = 31'' 48'''$; $x \cdot \frac{x-1}{2} = -·12455$;

$x \cdot \frac{x-1}{2} \cdot \frac{x-2}{3} = ·06125$.

Then A - - - - - - - - 31·544246
x D′ - - - - - - - - 154748
$x \cdot \frac{x-1}{2}$ D″ - - - - - - −664
$x \cdot \frac{x-1}{2} \cdot \frac{x-2}{3}$ D‴ - - - - - - 9
31·698339

In the 6th example the natural ſecant is found by the differential ſeries to be 31·698339. But by taking the number to the logarithm of it, as found in the 5th example, it is 31·698333; which ſeems to be the more accurate, as well as the eaſier way; and indeed this method by the ſeries, ſeems to be, in ſome inſtances, more troubleſome, and leſs accurate, than finding the ſecant by dividing 1 by the coſine.

2. Given any Sine, Tangent, &c. to find its Arc.

Take the difference between the next leſs and greater tabular numbers of the ſame kind, and the difference between the given number and the ſaid next leſs or next greater tabular number, according as the given number is a ſine, tangent, &c. or a coſine, cotangent, &c. noting its degrees and minutes; then the two differences will be the terms of a vulgar fraction of a minute, to be added to thoſe minutes, to give the arc required.

And this vulgar fraction may alſo, if required, be reduced to a decimal by dividing the leſs or numerator by the denominator, or brought to ſexageſimals, by multiplying by 60, &c. Alſo where the tabular differences are printed, the ſubtraction of the leſs tabular number from the greater is ſaved.

EXAMPLES.

1. To find the arc to the natural fine ·0315474.

The

The above method of proportioning by the firſt difference alone, can only be true when the other differences are nothing, or very ſmall; but other means muſt be uſed when they are large, viz. for the natural tangents and ſecants of very large arcs; and for the logarithmic ſines, and verſed ſines of ſmall arcs, alſo the log. ſecants of large arcs, with the log. tangents and cotangents both of ſmall and large arcs. When the log. ſine, verſed ſine, or tangent of a ſmall arc is given, by means of the table of logarithms find the correſponding natural number, and then the arc anſwering to it in the table of natural ſines, &c. But when the log. tangent or ſecant of a large arc is propoſed, ſubtract it from 20, the remainder is the log. cotangent or coſine, which will be the log. tangent or ſine of a ſmall arc which is the complement of that required, which complement will be found as in the laſt remark, by taking the correſponding natural number, and finding it in the natural tangents or ſines; then ſubtracting that complemental arc from 90°, leaves the required large arc anſwering to the propoſed log. tangent or ſecant. And when the natural tangent or ſecant of a large arc is propoſed, change it into the log. tangent or ſecant of the ſame, by taking the log. of the propoſed natural number; then proceed with it as above in the laſt remark.

EXAMPLES.

1. To find the arc to natural tangent 50·0000000.

20·0000000
Given 50·0000000 its log. 11·6989700

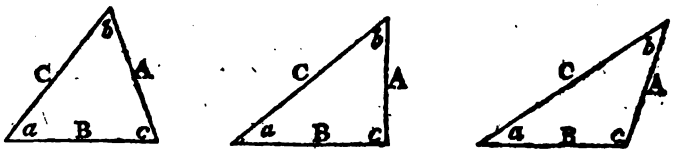
TRIGONOMETRICAL RULES.

I. IN a right-lined triangle, whoſe ſides are A,B,C, and their oppoſite angles *a*, *b*, *c*; having given any three of theſe, of which one is a ſide; to find the reſt.



Put s for the ſine, s′ the coſine, t the tangent, and t′ the cotangent of an arc or angle, to the radius *r*; alſo L for a logarithm, and L′ its arithmetical complement. Then

Caſe 1. When three ſides A,B,C, are given.

Put $P = \frac{1}{2}.\ \overline{A+B+C}$ or ſemiperimeter.

Then $s.\frac{1}{2}c = r\sqrt{\frac{\overline{P-A}\times\overline{P-B}}{A\times B}}$.

And $s'\frac{1}{2}c = r\sqrt{\frac{P\times\overline{P-C}}{A\times B}}$.

$L.s.\frac{1}{2}c = \frac{1}{2}(L.\overline{P-A} + L.\overline{P-B} + L'A + L'B)$.

$L's.\frac{1}{2}c = \frac{1}{2}(L.P + L.\overline{P-C} + L'A + L'B)$.

Note, When A = B, then $s.\frac{1}{2}c = \frac{C}{A}\times\frac{r}{2}$. And $s'\frac{1}{2}c = r\sqrt{\frac{A^2-\frac{1}{4}C^2}{A^2}}$:

Caſe 2. Given two ſides A,B, and their included angle *c*.

Put $s = 90^\circ - \frac{1}{2}c$, and $t.d = \frac{A-B}{A+B}\times t.s$; then $a = s+d$; and $b = s-d$. And

$c = \sqrt{\frac{4AB\cdot s^2\frac{1}{2}c}{rr} + \overline{A-B}^2}$.

Or in logarithms, putting $L.Q = 2L.\overline{A-B}$, and $L.R = L.2A + L.2B + 2L.s.\frac{1}{2}c - 20$, we ſhall have $L.c = \frac{1}{2}L.\overline{Q+R}$.

If the angle *c* be right, or = 90°; then $t.a = \frac{A}{B}r$; $t.b = \frac{B}{A}r$;

$c = \frac{r}{s.a}A$, or $= \frac{r}{s.b}B$, or $= \sqrt{\overline{A+B}^2}$.

If A = B; we ſhall have $a = b = 90^\circ - \frac{1}{2}c$, and $c = \frac{s.\frac{1}{2}c}{r}\times 2A$.

Caſe 3. When a ſide and its oppoſite angle are among the terms given.

Then $\frac{A}{s.a} = \frac{B}{s.b} = \frac{C}{s.c}$; from which equations any term wanted may be found.

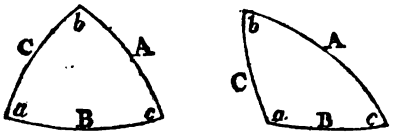
When an angle, as *a*, is 90°, and A and c are given, then

$B = \sqrt{A^2 - c^2} = \sqrt{\overline{A+c}\times\overline{A-c}}$.

And $L.B = \frac{1}{2}(L.\overline{A+c} + L.\overline{A-c})$.

Note, When two ſides A,B, and an angle *a* oppoſite to one of them, are given; if A be leſs than B, then *b*, *c*, c have each two values; otherwiſe, only one value.

II. In a ſpheric triangle, whoſe three ſides are A,B,C, and their oppoſite angles *a*, *b*, *c*; any three of theſe ſix terms being given, to find the reſt.



Caſe 1. Given the three ſides A,B,C.

Calling 2P the perim. or $P=\frac{1}{2}\cdot A+B+C$.

Then $s.\frac{1}{2}c=r\sqrt{\frac{s.\overline{P-A}\times s.\overline{P-B}}{s.A\times s.B}}$.

And $s'\frac{1}{2}c=r\sqrt{\frac{s.P\times s.\overline{P-C}}{s.A\times s.B}}$.

$L.s.\frac{1}{2}c=\frac{1}{2}(L.s.\overline{P-A}+L.s.\overline{P-B}+L's.A+L's.B)$.

$L.s'\frac{1}{2}c=\frac{1}{2}(L.s.P+L.s.\overline{P-C}+L's.A+L's.B)$.

And the ſame for the other angles.

Caſe 2. Given the three angles.

Put $2p=a+b+c$. Then

$s.\frac{1}{2}c=r\sqrt{\frac{s'p\times s'\overline{p-c}}{s.a\times s.b}}$. And

$s'\frac{1}{2}c=r\sqrt{\frac{s'\overline{p-a}\times s'\overline{p-b}}{s.a\times s.b}}$.

$L.s.\frac{1}{2}c=\frac{1}{2}(L.s'p+L.s'\overline{p-c}+L's.a+L's.b)$.

$L.s'\frac{1}{2}c=\frac{1}{2}(L.s'\overline{p-a}+L.s'\overline{p-b}+L's.a+L's.b)$.

And the ſame for the other ſides.

Note. The ſign < ſignifies greater than, and > leſs; alſo ∽ the difference.

Caſe 3. Given A,B, and included angle *c*.

To find an angle *a* oppoſite the ſide A, let $r:s'c::t.A:t.M$, like or unlike A, as *c* is < or > 90°; alſo $N=B\backsim M$:

then $s.N:s.M::t.c:t.a$, like or unlike *c* as M is < or > B.

Or let $s'\frac{1}{2}\cdot\overline{A+B}:s'\frac{1}{2}\cdot A\backsim B::t'\frac{1}{2}c:t.M$, which is > or < 90° as $A+B$ is > or < 180°; and $s.\frac{1}{2}\cdot\overline{A+B}:s.A\backsim B::t'\frac{1}{2}c:t.N$, < 90°. then $a=M+N$; and $b=M-N$.

Again let $r:s'c::t.A:t.M$, like or unlike A as *c* is < or > 90°; and $N=B\backsim M$.

Then $s'M:s'N::s'A:s'c$, like or unlike N as *c* is ∠ or ⊿ 90°. Or,

$s.\frac{1}{2}c=\sqrt{\frac{s.A\times s.B\times s^2\frac{1}{2}c}{rr}+s^2\frac{1}{2}.\overline{A\backsim B}}$.

In logarithms, put $L.Q=2L.s.\frac{1}{2}\overline{A\backsim B}$; and $L.R=L.s.A+L.s.B+2L.s.\frac{1}{2}c-20$; then $L.s.\frac{1}{2}c=\frac{1}{2}L.\overline{Q+R}$.

Caſe 4. Given *a*, *b*, and included ſide c.

Firſt, let $r:s'c::t.a:t'm$, like or unlike *a* as c is < or > 90°; alſo $n=b\backsim m$.

Then $s'n:s'm::t.c:t.A$, like or unlike *n* as *a* is < or > 90°.

Or, let $s'\frac{1}{2}\cdot\overline{a+b}:s'\frac{1}{2}\cdot a\backsim b::t.\frac{1}{2}c:t.M$, > or < 90° as $a+b$ is > or < 180°;

and $s.\frac{1}{2}\overline{a+b}:s.\frac{1}{2}\overline{a\backsim b}::t.\frac{1}{2}c:t.N$, < 90°; then $A=M\pm N$; and $B=M\mp N$.

Again, let $r:s'c::t.a:t'm$, like or unlike *a* as c is < or > 90°; and $n=b\backsim m$:

then $s.m.:s.n.::s'a:s'c$, like or unlike *a* as *m* is < or > *b*.

Caſe 5. Given A, B, and an oppoſite angle *a*.

1ſt. $s.A:s.a::s.B:s.b$, < or > 90°.

2nd. Let $r:s'B::t.a:t'm$, like or unlike B as *a* is < or > 90°;

and $t.A:t.B::s'm:s'n$, like or unlike A as *a* is < or > 90°;

then $c=m\pm n$, two values alſo.

3dly. Let $r:s'a:t.B:t.M$, like or unlike B as *a* is < or > 90°;

and $s'B:s'A::s'M:s'N$, like or unlike A as *a* is < or > 90°:

then $c=M\pm N$, two values alſo.

But if A be equal to B, or to its ſupplement, or between B and its ſupplement; then is *b* like to B: alſo *c* is $=m\pm n$, and $c=M\pm N$, as B is like or unlike *a*.

Caſe 6. Given *a*, *b*, and an oppoſite ſide A.

1ſt. $s.a.:s.A::s.b:s.B$, < or > 90°.

2nd.

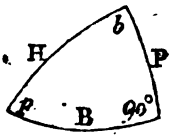
and, Let r : s'b :: t. A : t. M, like or unlike b as A is $<$ or $>$ 90°;
and t. a : t. b :: s. M : s. N, $<$ or $>$ 90°:
then c $=$ M $\pm$ N, as a is like or unlike b.

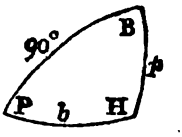
3dly. Let r : s'A :: t. b : t'm, like or unlike b as A $<$ or $>$ 90°;
and s'b : s'a :: s. m : s. n, $<$ or $>$ 90°:
then $c = m \pm n$, as a is like or unlike b.

But if A be equal to B, or to its ſupplement, or between B and its ſupplement; then B is unlike b, and only the leſs values of N, n, are poſſible.

Note, When two ſides A, B, and their oppoſite angles a, b, are known; the third ſide c, and its oppoſite angle c, are readily found thus:

s. $\frac{1}{2}\overline{a \circledcirc b}$; s. $\frac{1}{2}.\overline{a+b}$ :: t. $\frac{1}{2}$ A $\circledcirc$ B : t. $\frac{1}{2}$ c.
s. $\frac{1}{2}.\overline{\text{A} \circledcirc \text{B}}$; s. $\frac{1}{2}.\overline{\text{A}+\text{B}}$ :: t. $\frac{1}{2}.\overline{a \circledcirc b}$: t. $\frac{1}{2}c$.





III. In a right-angled ſpheric triangle, where H is the hypotenuſe, or ſide oppoſite the right angle, B, P the other two ſides, and b, p their oppoſite angles; any two of theſe five terms being given, to find the reſt: the caſes, with their ſolutions, are as in the following table.

The ſame table will alſo ſerve for the quadrantal triangle, or that which has one ſide $= 90°$, H being the angle oppoſite that ſide, B, P the other two angles, and b, p their oppoſite ſides: obſerving, inſtead of H to take its ſupplement; and mutually change the terms *like* and *unlike* for each other where H is concerned.

Caſe	Given	Req^d.	SOLUTIONS.
1	H, B	b	s.H : r :: s.B : s.b, and is like B
		p	r : t'H :: t.B : s'p, $<$ or $>$ 90° as H is like or unlike B
		P	s'B : r :: s'H : s'P,
2	H, b	B	r : s.H :: s.b : s.B, like b
		P	r : s'b :: t.H : t.P, $<$ or $>$ 90° as H is like or unlike b
		p	: s'H :: t.b : t'p

The following Propoſitions and Remarks, concerning Spherical Triangles, (ſelected and communicated by the Reverend Nevil Maſkelyne, D.D. Aſtronomer Royal, and F.R.S.), will alſo render the Calculation of them perſpicuous, and free from Ambiguity.

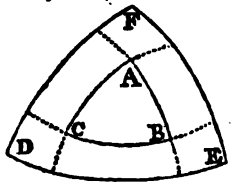
"1. A ſpherical triangle is equilateral, iſoſcelar, or ſcalene, according as it has its three angles all equal, or two of them equal, or all three unequal; and *vice verſa*.

2. The greateſt ſide is always oppoſite the greateſt angle, and the ſmalleſt ſide oppoſite the ſmalleſt angle.

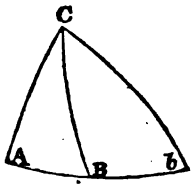
3. Any two ſides taken together, are greater than the third.

4. If the three angles are all acute, or all right, or all obtuſe; the three ſides will be, accordingly, all leſs than 90°, or equal to 90°, or greater than 90°; and *vice verſa*.

5. If from the three angles A, B, C, of a triangle ABC, as poles, there be deſcribed, upon the ſurface of the ſphere, three arches of a great circle DE, DF, FE, forming by their interſections a new ſpherical triangle DEF; each ſide of the new triangle, will be the ſupplement of the angle at its pole; and each angle of the ſame triangle, will be the ſupplement of the ſide oppoſite to it in the triangle A B C.

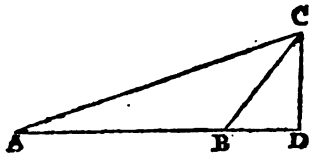


6. In any triangle ABC, or A*b*c, right angled in A, 1ſt, The angles at the hypotenuſe are always of the ſame kind as their oppoſite ſides; 2dly, The hypotenuſe is leſs or greater than a quadrant, according as the ſides including the right angle, are of the ſame or different kinds; that is to ſay, according as theſe ſame ſides are either both acute or both obtuſe, or as one is acute and the other obtuſe. And, *vice verſa*, 1ſt, The ſides including the right angle, are always of the ſame kind as their oppoſite angles; 2dly, The ſides including the right angle will be of the ſame or different kinds, according as the hypotenuſe is leſs or more than 90°; but one at leaſt of them will be of 90°, if the hypotenuſe is ſo."



THE CASES OF PLANE TRIANGLES RESOLVED BY LOGARITHMS.

IN this and the following ſolutions of ſpherical triangles, it is to be obſerved, that when we ſay the ſine, tangent, &c. we mean the logarithmic ſine, tangent, &c, as found by the table,



Prop. I. *Having the angles, and one ſide; to find either of the other ſides.*

Add the logarithm of the given ſide to the ſine of the angle oppoſite to the ſide required, and from the ſum ſubtract the ſine of the angle oppoſed to the given ſide; the remainder will be the logarithm of the ſide required.

Example. In the triangle BCD, having the angle CDB 90°, CBD 51° 56′, BCD 38° 4′, and the ſide BD 197·3; to find the ſide CD.

2·2951271 log. of 197·3
9·8961369 ſin. of 51° 56′
12·1912640 ſum
9·7899880 ſin. of 38 4
2·4012760 log. 251·9278 CD req,

Or you may add the complement of the ſine of the angle oppoſed to the given ſide, to the two other logarithms, the ſum, (abating radius) is the logarithm of the ſide required; as ſhewn in art. 3, of Log. Arith. And it is to be obſerved, that the complements of the ſines in the table are to be found in the columns of the coſecants: for (paſſing over the firſt unit), the coſecants of the ſame ares, are the complements of the ſame ſines. Alſo the complements of the tangents, are the cotangents.

Example. The ſine of 38° 4′ being 9·7899880, the coſecant of 38° 4′ is 10·2100120, which (omitting the firſt unit), is the complement of the ſaid ſine,

9·2100120 co. of ſin. 38° 4′
2·2951271 log. of 197·3
9·8961369 ſin. of 51° 56′
2·4012760 log. 251·9278, as bef.

But if one ſide and the angles of a right-angled triangle be known, and you would have the other ſide, as in the former example, the operation will be eaſier, thus;

Add the tangent of the angle oppoſite to the ſide required, to the logarithm of the given ſide, the ſum (abating radius) is the logarithm of the ſide required.

10·1061489 tang. 51° 56′
2·2951271 log. of 197·3
2·4012760 log. 251·9278 as bef.

Prop. II. *Having two ſides, and an angle oppoſite to one of them; to find the other two angles, and the third ſide.*

Add the ſine of the angle given, to the logarithm of the ſide adjoining that angle, and from the ſum ſubtract the logarithm of the ſide oppoſite to that angle, or add its ar. com. the remainder or ſum will be the ſine of the angle oppoſite to the adjoining ſide.

Example. In the triangle ABC, having the ſide AC 890, BC 320, and the

the angle ABC 128° 4′; to find the angles BAC, ACB, and the ſide AB.

7·0969100 ar. com. log. 800.
2·5051500 log. of 320.
9·8961369 ſin. 128° 4′
9·4981969 ſin. 18 21 BAC.

Having BAC and ABC, the angle ACB is their complement to 180° viz. 33° 35′; and you may find the ſide AB by the firſt propoſition.

Prop. III. *Having two ſides, and the angle between them; to find the other two angles, and the third ſide.*

If the angle included be a right angle, add the radius to the logarithm of the leſſer ſide, and from the ſum ſubtract the logarithm of the greater ſide, or add its ar. com. the remainder or ſum will be the tangent of the angle oppoſed to the leſſer ſide.

Example. In the triangle BCD, having the ſide BE 197·3, and CD 251·9; to find the angles BCD, CBD, and the ſide CB.

7·5987728 ar. com. log. 251·9
12·2951271 rad. + log. 197·3
9·8938989 tan. 38° 4′ BCD.

But if the angle included be oblique; add the logarithm of the difference of the given ſides to the tangent of half the ſum of the unknown angles, and from the ſum ſubtract the logarithm of the ſum of the given ſides, or add its complement; the remainder or ſum will be the tangent of half their difference.

Example. In the triangle ABC, having the ſide AB 562, BC 320, and the angle ABC 128° 4′; to find the angles BAC, ACB, and the ſide AC.

The ſum of the given ſides is 882, and the difference 242, the half ſum of the unknown angles is 25° 58′.

7·0545314 comp. log. 882
2·3838154 log. of 242
9·6875402 tang. 25° 58′
9·1258870 tang. 7 37
25 58

Angle ACB - - 33 35 ſum,
Angle CAB - - 18 21 dif.

Theſe 7° 37′ being added to 25° 58′ the half ſum of the angles unknown, the ſum is 33° 35′ for the greater angle ACB, and the ſame 7° 37′ being ſubtracted from 25° 58′, the remainder is 18° 21′ for the leſſer angle CAB. Laſtly, knowing the angles, and two ſides, the third-ſide may be found by the firſt propoſition.

Prop. IV. *Having the three ſides; to find any angle.*

Add the three ſides together, and take half the ſum, and the differences betwixt the half ſum and each ſide: then add the complements of the logarithms of the half-ſum, and of the difference between the half-ſum and the ſide oppoſite to the angle ſought, to the logarithms of the differences of the half-ſum and the other ſides; half their ſum will be the tangent of half the angle required.

Example. In the triangle ABC, having the ſide AB 562, AC 800, and BC 320, to find the angle ABC.

AC = 800	H = 841.	co.	7·0752040
AB = 562	H — AC = 41	co.	8·3872161
BC = 320	H — AB = 279		2·4456042
ſum 1682	H — BC = 521		2·7168377
½ ſum 841 = H		ſum	20·6248620

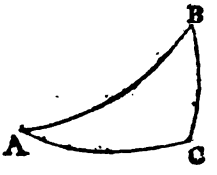
Tang. of 64° 2′ = ½ ſum 10·3124310
Whoſe double 128° 4′ is the angle ABC.

THE

THE CASES OF SPHERICAL TRIANGLES RESOLVED BY LOGARITHMS.

THE reſolution of ſpherical triangles is to be performed by the table of ſines, tangents and ſecants; which we ſhall ſhew by the 28 propoſitions following; whereof 16 are of right-angled, and 12 are of oblique trianges; and firſt

Of the right-angled triangles.



Prop. I. *Having the legs; to find the hypotenuſe.*

Add the coſine of one leg, to the coſine of the other leg; the ſum, (abating radius) is the coſine of the hypotenuſe required.

Example. In the right-angled triangle ABC, having AC 27° 54′, and BC 11° 30′; to find AB the hypotenuſe.

9·9911927 coſin. 11° 30′
9·9463371 coſin. 27 54
9·9375298 coſin. 30 AB req.

Prop. II. *Having the two legs; to find either of the angles.*

Add the fine of the leg next the angle ſought, to the cotangent of the other leg; the ſum, (abating radius) is the cotangent of the angle required.

Example. In the right-angled triangle ABC, having AC 27° 54′, and BC 11° 30′; to find the angle BAC.

9·6701807 ſin. next leg 27° 54′
10·6915374 cot. opp. leg. 11 30
10·3617181 cotan. BAC 23 30

Prop. III. *Having the hypotenuſe, and one of the angles; to find the other angle.*

Add the coſine of the hypotenuſe to the tangent of the angle given; the ſum, (abating radius) is the cotangent of the angle required.

Example. In the right-angled triangle ABC, having the hypotenuſe AB 30°, and the angle ABC 69° 22′; to find the angle BAC.

9·9375306 coſin. hyp. AB. 30°00′
10·4241896 tang. ABC - 69 22
10·3617202 cotan. BAC - 23 30

Prop. IV. *Having the hypotenuſe, and one of the angles; to find the leg next the given angle.*

Add the tangent of the hypotenuſe to the coſine of the angle given; the ſum, (abating radius) is the tangent of the leg required.

Example. In the right-angled triangle ABC, having the hypotenuſe AB 30°, and the angle ABC 69° 22′; to find the leg BC.

9·7614393 tang. hyp. AB 30°00′
9·5470188 coſin. ABC - 69 22
9·3084581 tang. BC - 11 30

Prop. V. *Having the hypotenuſe, and one of the angles; to find the leg oppoſed to the given angle.*

Add the fine of the hypotenuſe to the ſine of the angle given; the ſum, (abating radius) is the ſine of the leg required.

Example. In the right-angled triangle ABC, having the hypotenuſe AB 30°, and the angle BAC 23° 30′; to find the leg BC.

9·6989700 ſin. hyp. AB 30° 00′
9·6000997 ſin. BAC - 23 30
9·2996697 ſin. BC - 11 30

Prop.

Prop. VI. *Having one of the legs, and the angle next it; to find the hypotenuſe.*

Add the cotangent of the given leg, to the cofine of the given angle; the ſum, (abating radius) is the cotangent of the hypotenuſe required.

Example. In the right-angled triangle ABC, having the leg AC 27° 54′, and the angle BAC 23° 30′; to find the hypotenuſe AB.

10·2761563 cot. AC - 27° 54′
9·9623977 cof. BAC - 23 30
10·2385540 cot. hyp. AB 30 00

Prop. VII. *Having one of the legs, and the angle next it; to find the other leg.*

Add the fine of the leg given to the tangent of the angle given; the ſum, (abating radius) is the tangent of the leg required.

Example. In the right-angled triangle ABC, having the leg AC 27° 54′, and the angle BAC 23° 30′; to find the leg BC.

9·6701807 ſin. AC 27° 54′
9·6383019 tan. BAC 23 30
9·3084826 tan. BC 11 30

Prop. VIII. *Having one of the legs, and the angle next it; to find the other angle.*

Add the cofine of the given leg to the fine of the given angle; the ſum, (abating radius) is the cofine of the angle required.

Example. In the right-angled triangle ABC, having the leg BC 11° 30′, and the angle ABC 69° 22′; to find the angle BAC.

9·9911927 cof. BC 11° 30′
9·9712084 ſin. ABC 69 22
9·9624011 cof. BAC 23 30

Prop. IX. *Having one of the legs, and the angle oppoſed unto it; to find the hypotenuſe.*

Add the radius to the fine of the given leg, and from the ſum ſubtract the fine of the given angle, or add its coſecant; the remainder or ſum is the fine of the hypotenuſe required.

Example. In the right-angled triangle ABC, having the leg BC 11° 30′, and the angle BAC 23° 30′; to find the hypotenuſe AB.

9·2996553 ſin. BC 11° 30′
0·3993003 cof. BAC 23 30
9·6989556 ſin. AB 30 reqd.

Prop. X. *Having one of the legs, and the angle oppoſed unto it; to find the other leg.*

Add the tangent of the given leg, to the cotangent of the given angle; the ſum, (abating radius) is the fine of the leg required.

Example. In the right-angled triangle ABC, having the leg BC 11° 30′, and the angle BAC 23° 30′; to find the leg AC.

9·3084626 tang. BC 11° 30′
10·3616981 cot. BAC 23 30
9·6701607 ſin. AC 27 54

Prop. XI. *Having one of the legs, and the angle oppoſed unto it; to find the other angle.*

Add the radius to the cofine of the given angle, and from the ſum ſubtract the cofine of the given leg, or add the ſecant; the remainder or ſum is the fine of the angle required.

Example. In the right-angled triangle ABC, having the leg BC 11° 30′, and the angle BAC 23° 30′; to find the angle ABC.

9·9623977 cof. BAC 23° 30′
0·0088073 ſec. BC 11 30
9·9712050 ſin. ABC 69 22

Prop. XII. *Having one of the legs, and the hypotenuſe; to find the angle next the given leg.*

Add the tangent of the given leg, to the cotangent of the hypotenuſe, the ſum (abating radius) is the cofine of the angle required.

Example.

Example. In the right-angled triangle ABC, having the leg AC 27° 54′, and the hypotenuſe AB 30°; to find the angle BAC.

9·7238436 tan. AC	27°	54′
10·2385606 cot. AB	30	00
9·9624042 cof. BAC	23	30

Prop. XIII. *Having one of the legs, and the hypotenuſe; to find the angle oppoſed to the given leg.*

Add the radius to the ſine of the given leg, and from the ſum ſubtract the ſine of the hypotenuſe, or add its coſecant; the remainder or ſum will be the ſine of the angle required.

Example. In the right-angled triangle ABC, having the leg BC 11° 30′, and the hypotenuſe AB 30°; to find the angle BAC.

9·2996553 ſin. leg BC	11°	30′
0·3010300 coſec. hyp. AB	30	00
9·6006853 ſine of BAC	23	30

Prop. XIV. *Having one of the legs, and the hypotenuſe; to find the other leg.*

Add the radius to the coſine of the hypotenuſe, and from the ſum ſubtract the coſine of the given leg, or add its ſecant; the remainder or ſum is the coſine of the leg required.

Example. In the right-angled triangle ABC, having the leg BC 11° 30′ and the hypotenuſe AB 30°; to find the leg AC.

9·9375306 coſin. AB	30°	00′
0·0088073 ſec. BC	11	30
9·9463379 coſin. AC	27	54

Prop. XV. *Having the angles; to find the hypotenuſe.*

Add the cotangent of one oblique angle to the cotangent of the other oblique angle; the ſum, (abating radius) is the coſine of the hypotenuſe required.

Example. In the right-angled triangle ABC, having the angle BAC 23° 30′, and the angle ABC 69° 22′; to find the hypotenuſe AB.

0·3616981 cot. BAC	23°	30′
9·5758104 cot. ABC	69	22
9·9375085 coſ. hyp. AB	30	00

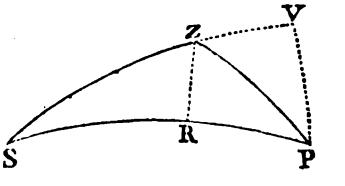
Prop. XVI. *Having the angles; to find either of the legs.*

Add the radius to the coſine of either oblique angle, and from the ſum ſubtract the ſine of the other oblique angle, or add its coſecant; the remainder or ſum will be the coſine of the leg oppoſite to the angle, whoſe coſine was taken.

Example. In the right-angled triangle ABC, having the angle BAC 23° 30′, and the angle ABC 69° 22′; to find the leg BC.

9·9623977 coſin. BAC	23°	30′
0·0287916 coſec. ABC	69	22
9·9911893 coſin. BC	11	30

Of Oblique Triangles.



Prop. XVII. *Having the three ſides, to find any of the angles.*

Add the three ſides, and take half the ſum, and the difference between the half ſum and the ſide oppoſite to the angle ſought. Then add the coſecants, or the complements of the ſines, of the other ſides, to the ſines of the half ſum and of the ſaid difference; half the ſum of theſe four logarithms is the coſine of half the angle required.

Example. In the triangle SZP, having the ſide ZS 40°, PS 70°, and PZ 38° 30′; to find the angle ZPS.

PS = 70° 0′	cosec.	0·0270142
PZ = 38 30	cosec.	0·2058505
ZS = 40 0	sin. ½ sum	9·9833805
Sum 148 30	sin. dif.	9·7503579
½ sum 74 15		2)19·9666031
ZS = 40 0	cos. 15° 47′	9·9833015
Diff. 34 15	ZPS 31 34	required.

Prop. XVIII. *Having the three angles; to find any of the sides.*

Let the angles be changed into sides, taking the supplement of the greater; then the operation will be the same as in the former proposition.

Prop. XIX. *Having two angles, and a side opposed to one of them; to find the side opposed to the other angle.*

Add the sine of the side given to the sine of the angle opposite to the side required, and from the sum subtract the sine of the angle opposite to the side given, or add its cosecant; the remainder or sum will be the sine of the side required.

Example. In the triangle SZP, having the angle, SZP 130° 3′ 12″, SPZ 31° 34′ 26″, and the side ZS 40°; to find the side PS.

9·8080675	sin. ZS	40°	0′	0″
9·8838294	sin. SZP	49	56	·
850		·	·	48
0·2808858	cos. SPZ	31	35	·
1165		·	·	−34
9·9729842	sin. PS reqd.	70	0	0

See pa. 168 following.

Prop. XX. *Having two angles, and a side opposed to one of them; to find the side between the angles given.*

Let a perpendicular fall from the angle unknown, upon its opposite side: then add the cosine of the given angle next the given side, to the tangent of the given side; the sum, (abating radius) is the tangent of the first arc, comprehended between the given angle next the given side, and the segment of the side where the perpendicular falls.

And the second arc comprehended between the same segment and the other angle, is to be found thus; add the sine of the arc found, to the tangent of the given angle next the given side, and from the sum subtract the tangent of the other angle given, or add its cotangent; the remainder or sum will be the sine of the second arc.

The sum or difference of these two arcs will be the side required.

Example. In the triangle SZP, having the angle ZPS 31° 34′ 26″, ZSP 30° 28′ 12″, and the side PZ 38° 30′; to find the side SP.

9·9308781	cos. ZPS	31°	35′	″
440		·	·	−34
9·9006052	tan. PZ	38	30	0
9·8310273	tan. PR 1st arc	34	7	30
9·7488698	sin. PR	34	7	·
932		·	·	30
9·7884529	tan. ZPS	31	34	·
1227		·	·	26
0·2301404	cot. ZSP	30	29	·
2313		·	·	−48
9·7679103	sin. SR 2d arc	35	52	30
	add PR 1st arc	34	7	30
	sum is SP	70	0	0

See page 168 following.

But when the perpendicular falls out of the triangle, the difference of the two arcs will be the side required.

Prop. XXI. *Having two angles, and a side opposite to one of them; to find the third angle.*

Let a perpendicular fall from the angle unknown, upon its opposite side: then add the cosine of the given side to the tangent of the adjacent angle; the sum, (abating radius) is the cotangent of the first angle to be found, comprehended by the given side and the perpendicular.

And the second angle, comprehended by the perpendicular and the side unknown, is to be found thus: add the sine of the angle found, to the cosine of the given angle opposite to the given side,

ſide, and from the ſum ſubtract the coſine of the other angle given, or add its ſecant; the remainder or ſum will be the ſine of the ſecond angle.

The ſum or difference of theſe two angles will be the angle required.

Example. In the triangle SZP, having the angle ZPS 31° 34′ 26″, ZSP 30° 28′ 12″, and the ſide PZ 38° 30′; to find the angle SZP.

9·8935444	coſin. PZ	38° 30′ 0″	
9·7884529 1227	tang. ZPS	31 34 .	
		. . 26

		. . 26	
9·9598447	ſin. 2d ∠ SZR	65 44 21	
	then add 1ſt ∠ PZR	64 18 50	
	the ſum is SZP	130 3 11	

See page 168 following.

But when the perpendicular falls out of the triangle, the difference of the two angles will be the angle required.

Prop. XXII. *Having two ſides, and the angle between them; to find either of the other angles.*

Let a perpendicular fall from the unknown angle, which is not required, upon its oppoſite ſide: then add the coſine of the given angle to the tangent of the given ſide oppoſite to the angle required; the ſum, (abating radius) is the tangent of the firſt arc, comprehended between the given angle and the ſegment of the given ſide where the perpendicular falls.

And the ſecond arc is the difference of that ſide and the firſt arc, being comprehended between the ſame ſegment and the angle required.

Now add the ſine of the firſt arc, to the tangent of the given angle, and from the ſum ſubtract the ſine of the ſecond arc, or add its coſecant; the remainder or ſum will be the tangent of the angle required.

Example. In the triangle SZP, having the ſide PZ 38° 30′, PS 70°, and the angle ZPS 31° 34′ 26″; to find the angle ZSP.

9·9303781 440	coſin. ZPS	31° 34′ .

To find both the unknown angles.

Add together the coſecant, or the complement of the ſine, of half the ſum of the given ſides, the ſine of half their difference, and the cotangent of half the angle given; the ſum, (abating radius) is the tangent of half the difference of the angles required.

Add alſo together the ſecant, or the complement of the coſine, of half the ſum of the given ſides, the coſine of half their difference, and the cotangent of half the angle given; the ſum, (abating radius) is the tangent of half the ſum of the angles required.

Then add the half difference of the angles required, to their half ſum, and you will have the greater angle; and ſubtract the half-difference from the half-ſum, and you will have the leſſer angle required, the ſame as in the former operation.

PS =	70° 0′	Cosec. ½ sum	0·0906719

T. 80°15′42″	10·7654172

Half sum of angles required is . 80° 15′ 42″.
Half the difference is 49 47 30
The greater angle SZP is . . . 130 3 12
The leſſer angle ZSP is, as before, . 30 28 12

Prop. XXIII. *Having two ſides, and the angle between them; to find the third ſide.*

Let a perpendicular fall from either of the angles unknown, upon its oppoſite ſide: then add the coſine of the given angle, to the tangent of the ſide from whoſe end the perpendicular is let fall; the ſum (abating radius) is the tangent of the firſt arc, comprehended between the given angle and the ſegment of the ſide where the perpedicular falls.

And the ſecond arc is the difference of that ſide and the firſt arc, being comprehended between the ſame ſegment and the end of the ſide required.

Now add the coſine of the ſecond arc, to the coſine of the ſide from whoſe end the perpendicular falleth, and from the ſum ſubtract the coſine of the firſt arc found, or add its ſecant; the remainder or ſum will be the coſine of the ſide required.

Example. In the triangle SZP, having the ſide PZ 38° 30′, PS 70°, and the angle ZPS 31° 34′ 26″; to find the ſide ZS.

9·9303781 440	coſin. ZPS	31° 35′ .″	−34
9·9006052	tang. PZ	38 30 0	
9·8310273	tan. PR, 1ſt arc	34 7 30	
	taken from PS	70 0 0	
	leaves SR, 2d arc	35 52 30

9·7189961	ſin. ZPS req.	31 34 26	

See page 168 following.

Prop. XXV. *Having two ſides, and the angle oppoſite to one of them; to find the third ſide.*

Let a perpendicular fall from the angle between the ſides given, upon its oppoſite ſide: then add the coſine of the angle given, to the tangent of the given ſide next that angle; the ſum (abating radius) is the tangent of the firſt arc, comprehended between the given angle and the ſegment of the ſide where the perpendicular falls.

Now the 2d arc, comprehended between the ſame ſegment, and the end of the ſide required, is to be found thus: add the coſine of the firſt arc, to the coſine of the given ſide oppoſite to the angle given, and from the ſum

ſum ſubtract the coſine of the other given ſide, or add its ſecant; the remainder or ſum will be the coſine of the ſecond arc.

The ſum or difference of theſe two arcs will be the ſide required.

Example. In the triangle SZP, having the ſide PZ 38° 30′, SZ 40°, and the angle SPZ 31° 34′ 26″; to find the ſide PS.

9·9303781 440	coſin. SPZ	{	31°	35′ . .	—34
9·9006052	tang. PZ		38	30	0
9·8310273	tang. PR, 1ſt arc		34	7	30
9·9178908 428	coſin. PR	{	34	8 . .	-30
9·8842540	coſin. SZ .		40	0	0
0·1064556	ſec. PZ .		38	30	0
9·9086432	coſin. SR, 2d arc		35	52	30
	add PR, 1ſt arc		34	7	30
	gives PS req.		70	0	0

See page 168 following.

But when the perpendicular falls out of the triangle, the difference of the two arcs will be the ſide required.

Prop. XXVI. *Having two ſides, and the angle oppoſed to one of them; to find the angle between them.*

Let a perpendicular fall from the angle between the ſides given, upon it's oppoſite ſide: then add the coſine of the given ſide next the given angle, to the tangent of that angle; the ſum (abating radius) is the cotangent of the firſt angle to be found, comprehended by the given ſide next the angle given, and by the perpendicular.

Now the ſecond angle, comprehended by the perpendicular and the other given ſide, is to be found thus: add the coſine of the firſt angle found, to the tangent of the given ſide next the angle given, and from the ſum ſubtract the tangent of the other given ſide, or add its cotangent; the remainder or ſum will be the coſine of the ſecond angle to be found.

The ſum or the difference of the firſt and ſecond angles, will be the angle required.

Example. In the triangle SZP, having the ſide PZ 38° 30′, SZ 40°, and the angle SPZ 31° 34′ 26″; to find the angle SZP.

9·8935444	coſin. PZ . .		38°	30′	0″
9·7884529 1227	tang. SZP	{	31	34 . .	26

9·9006052	tang. PZ .		38	30	0
0·0761865	cotan. SZ .		40	0	0
9·6137213	coſin. SZR, 2d ∠		65	44	22
	add PZR, 1ſt ∠		64	18	50
	gives SZP, req.		130	3	12

See page 168 following.

Prop. XXVII. *Having two angles, and the ſide between them; to find either of the other ſides.*

Let a perpendicular fall from the given angle which is next the ſide required, upon its oppoſite ſide: then add the coſine of the given ſide to the tangent of the given angle oppoſite to the ſide required; the ſum (abating radius) is the cotangent of the firſt angle to be found, comprehended by the given ſide and the perpendicular.

And the ſecond angle is the difference between the firſt and the given angle next the required ſide, being comprehended by the perpendicular and that ſide.

Now add the coſine of the firſt angle found to the tangent of the ſide given, and from the ſum ſubtract the coſine of the ſecond angle, or add its ſecant; the remainder or ſum will be the tangent of the ſide required.

Example. In the triangle SZP, having the angle SPZ 31° 34′ 26″, SZP 130° 3′ 12″ and the ſide PZ 38° 30′; to find the ſide SZ.

To find both the unknown sides.

Add together the cosecant, or the complement of the fine, of half the sum of the angles given, the fine of half their difference, and the tangent of half the given side; the sum (abating radius) is the tangent of half the difference of the sides required.

Add also together the secant, or the complement of the cosine, of half the sum of the given angles, the cosine of half their difference, and the tangent of half the given side; the the sum, (abating radius) is the tangent of half the sum of the sides required.

Then add half the difference of the sides required, to their half sum, and you will have the greater side; and subtract the half difference from the half sum, and you will have the lesser side required, the same as in the former operation.

½ PZ	19 15 0		Lesser side SZ is, as before, ...		40

Prop. XXVIII. *Having two angles and the side between them; to find the third angle.*

Let a perpendicular fall from either of the angles given, upon its opposite side: then add the cosine of the side given to the tangent of the given angle, from which the perpendicular does not fall; the sum, (abating radius) is the cotangent of the first angle, comprehended by the given side and the perpendicular.

And the second angle is the difference between the first and the given angle that the perpendicular fell from, being comprehended by the perpendicular and the side opposite to the other angle given.

Now add the fine of the second angle to the cosine of that given angle from which the perpendicular did not fall, and from the sum subtract the fine of the first angle found, or add its cosecant; the remainder or sum will be the cosine of the angle required.

Example. In the triangle SZP, having the angle SZP 130° 3′ 12″, SPZ 31° 34′ 26″, and the side PZ 38° 30′; to find the angle PSZ.

FOR

FOR THE USE OF THE VERSED SINES MAY BE ALSO ADDED THE FOLLOWING PROPOSITIONS.

Prop. I. *Having two ſides of a ſpheric triangle, with the angle between them; to find the third ſide.*

ADD the log. verſed ſine of the contained angle, and the log. ſines of the two ſides together; the ſum (abating twice the radius) is the logarithm of a number to be found, which added to the natural verſed ſine of the difference of the two given ſides, the ſum will be the natural verſed ſine of the third ſide ſought.

Or when the contained angle is above 90°, add the log. verſed ſine of its ſupplement, and the log ſines of the two ſides together; the ſum (abating twice the radius) is the logarith of a number to be found, and ſubtracted from the natural verſed ſine of the ſum of the two given ſides, the remainder will be the natural verſed ſine of the third ſide ſought.

Example 1. In the triangle SZP, having the ſide PZ 38° 30′, PS 70°, and the angle ZPS 31° 34′ 26″; to find the ſide ZS.

9·1703625	log. ver. ſine	ZSP	31° 34′ 26″
9·7941496	log. ſine of	PZ	38 30 0

9·1542761	log. of the number		1426514
	Nat. verſ. ſum ſides		78° 30′ 8006321
	Nat. verſ.	PS	70° . . 6579807

This propoſition may be very uſeful in finding the diſtances of places on the earth, whoſe longitudes and latitudes are known; the diſtances of ſtars, whoſe declinations and right aſcenſions, or longitudes and latitudes, are known; and conſequently the altitudes, or common altitude of two ſtars, or two altitudes of the ſun, and time between the obſervations, or difference of azimuth, being taken, the latitude of the place may readily be found.

Prop. II. *Having two angles of a ſpheric triangle, and the ſide between them; to find the third angle.*

Let the angles be changed into ſides, and the ſide into an angle; then do as in the former propoſition, and the reſult will be the ſupplement of the third angle. But if one of the given angles exceed 90°, take its ſupplement, and the reſult will be the third angle.

The

The following remarks and directions, for rendering the proportional part of a logarithm always additive, and for using $c+t$, $c-t$, &c, for s or c &c. in the foregoing propositions, 20, 21, 22, 23, 25, 26, 27, 28, were communicated by the Rev. Nevil Maskelyne, D.D. astronomer royal, and F.R.S. the fourth case having been invented by him many years since, and delivered to the computors of the Nautical Ephemeris, as precepts necessary in computing the moon's distances from the stars in some cases, and the rest he has now added upon this occasion.

"The result of trigonometrical calculations, will be sometimes inaccurate, owing to the logarithms not being carried to a greater number of places in the table, as will sufficiently appear from the logarithmic differences being small. This will happen where the answer comes out in the cosine of a very small angle, or the sine of an angle near 90°. The irregularity of the logarithmic differences of the sines, tangents, and cotangents of small arcs, and the cosines, tangents, and cotangents of arcs near 90°, will sometimes affect the accuracy of the result, unless allowance be made for second differences &c.——In oblique angled spherical triangles, put t, t′, s, c for the tangent, cotangent, sine, and cosine of the 1st arc or angle mentioned in the foregoing propositions, then in the 2d part of the work,

In prop. 20,	if the first	arc	is very small,	for s	use c+t
21	- - -	angle	is very small,	for s	use c−t′
22	- - -	arc	is very small,	for s	use c+t
23	- - -	arc	is near 90°,	for −c	use t−s
25	- - -	arc	is near 90°,	for c	use s−t
26	- - -	angle	is near 90°,	for c	use s+t′
27	- - -	angle	is near 90°,	for c	use s+t′
28	- - -	angle	is very small,	for −s	use t′−c

This at the same time obviates the necessity of finding the first arc to a very minute exactness, and of allowing for second differences &c, which otherwise would be necessary in taking out the sine or cosine of the same arc in the second part of the work.

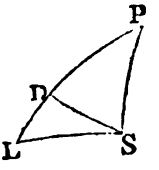
Where the foregoing precepts direct to subtract a sine or cosine, it will be readier in practice to add a cosecant or secant; and where they direct to subtract a tangent (which is done in prop. 26) it will be readier to add a cotangent. This method being used if it be required to find the logarithmic sines &c, to the exactness of a second, and the logarithm is increasing (as in the sines, tangents, and secants) write down the logarithm for the degree and minute without the seconds; and also write down the proportional part for the seconds; but, if the logarithm is decreasing (as in the cosines, cotangents, and cosecants) write down the logarithm for the next greater minute, and also write down the proportional part for the complement of the seconds to 60; and proceed in like manner with

with every logarithmic ſine, coſine, &c. uſed in the work; the ſum of all the logarithms (abating one or two radii or tens in the index, according as 2 or 3 logarithmic ſines &c are uſed in the part of the work in queſtion) will be the logarithmic ſine, coſine, tangent, or cotangent required.

Ex. 1. To find the log. ſine of 34° 17′ 24″
Here log. ſine of 34° 17′ - - 9·7507287
And as 60 : 24 or as 10 : 4 :: 1853 : - - 741
9·7508028

Ex. 2. To find the log. coſ. of 55° 42′ 36″
Log. coſ. of 55° 43′ - - - 9·7507287
60 : 24 (60 — 36), or 10 : 4 :: 1853 : - 741
9·7508028

Ex. 3. In the triangle PLS, given
P = 20° 30′ 48″
PS = 85 3 40
PL = 89 10 0
} to find LS by prop. 23; SD being perp. PL.



P 20° 31′ .″ coſ. - 9·9715404
. . — 12 - - - - - - 95
PS 85 3 . tan. 11·0624350 } coſ. found by taking tang. from ſine { - - - 8·9349686
. . 40 - - - - - 9814 }
for 2d diff. —5 }
PD 84 43 43 tan. 11·0349658 - - - - - - - - 11·0349658
PL 89 10 0 coſec. PD 84° 44′ .″ - 10·0018374
LD 4 26 17 — 17 - - - - 33
coſin. CD 4 27 . - - - 9·9986888
— 43 - - - - - 70
coſin LS 20 53 24 - - 9·9704709

Here, to avoid the trouble of 2d differences, the coſine of PS is found by ſubtracting the tangent of it (already found) from the ſine, which is eaſily found, becauſe the differences are ſmall: And, for the ſame reaſon, the ſum of the tangent and coſecant of PD, are uſed inſtead of its ſecant.

N.B. The perpendicular ſhould always be let fall from the end of the ſide, PS or PL, which differs moſt from 90°, over or under."

OF THE TRAVERSE TABLE.

THIS traverſe table, or table of difference of latitude and departure, in page 338 & 339, is ſo contrived, as to have the whole in one view, and is ſo plainly titled as to want little or no explication.

The diſtances 1, 2, 3, &c. at the top and bottom, may be accounted 10, 20, 30 &c. and the 10 as 100, if the minutes of latitude and departure anſwering to the courſe be increaſed in the ſame proportion; ſo that if the diſtance conſiſts of two ſignificant figures, the difference of latitude, and the departure, is each to be taken out at twice; and if of three figures, at thrice.

The chief deſign of this table is for the ready and exact working of traverſes; but it may alſo be applied to the ſolution of the ſeveral caſes of plain ſailing, and to ſome other uſes.

Prop. I. *Having the courſe and diſtance, to find the difference of latitude and departure.*

Seek the courſe on the left-hand of both pages downwards, if leſs than four points, or 45 degrees; or if greater, on the right hand upwards; and even with it in the double column, ſigned at the top and bottom with the diſtance, is found both the difference of latitude and the departure.

Example 1. A ſhip ſails s s w ½ w 37 miles; the difference of latitude, and the departure are required.

Find the courſe 2¼ points on the left-hand ſide of each page, and even with it in the double columns ſigned 3, and 7, the two figures of the diſtance, the difference of latitude for 30 is 25·732, and for 7 is 6·004; the ſum is 31·736 for the whole difference of latitude; and the departure for 30 is 15·423, and for 7 is 3·599, the ſum is 19·022 for the whole departure.

Thus, *Diſt.*	*Diff. Lat.*	*Dep.*
30	25·732	15·423
7	6·004	3·599
37 miles	31·736	19·022

Example 2. A ſhip ſails s E 49° 148 miles; the difference of latitude and the departure are required.

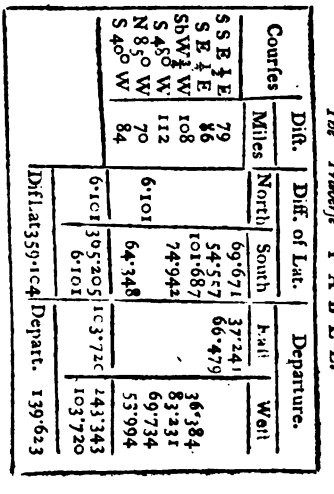
Find the courſe 49 degrees on the right-hand ſide of each page, and even with it in the double columns ſigned 10, 4, and 8, the difference of latitude at 100 miles is 65·606, at 40 is 26·242, and at 8 is 5·248; the ſum is 97·096 for the whole difference of latitude. And the departure at 100 miles is 75·471, at 40 is 30·188, and at 8 is 6·038; the ſum is 111·697 for the whole departure. Thus,

Diſt.	*Diff. Lat.*	*Depart.*
100	65·606	75·471
40	26·242	30·188
8	5·248	6·038
148 miles	97·096	111·697

Prop. II. *Having ſeveral courſes and diſtances, to find the difference of latitude, and the departure.*

Make a table in the following manner, and put therein each courſe and diſtance; then find the difference of latitude and departure to each courſe by the preceding, and place them in the proper column; the difference of the ſums of the northings and ſouthings, is the whole difference of latitude; and the difference of the ſums of the eaſtings and weſtings, is the whole departure.

Example. A ſhip from the latitude of 50° north, ſails according to the courſes and diſtances ſet in the traverſe table; the difference of latitude, and the departure are found at the bottom.



This

This propoſition may be applied in the ſurveying of large tracts of land, as a county, &c. and was made uſe of by Mr. Norwood in meaſuring the diſtance from York to London, as the road led him, and obſerving the ſeveral bearings by his circumferentor, and finding by ſuch a table his ſeveral differences of latitude, and departures, whereby he obtained the diſtance between the parallels of London and York pretty near the truth, ſo long ago as the year 1635: as may be ſeen in his Seaman's Practice.

Alſo in plotting the ſurvey of a county thus taken, the circuit ſtation-lines, though conſiſting of many hundreds, may be reduced to a few for the firſt cloſing, and the like for the intermediates of each line firſt plotted, whereby every ſtation may perhaps be more truly placed than by any other method: the diſtances in the table may be chains of 66, or 100 feet as well as miles, or any other meaſure that the differences of latitude and departure would be had in.

Prop. III. *Having the difference of latitude, and the departure; to find the courſe and diſtance.*

Seek the given difference of latitude and departure, taken together, in their columns, or the neareſt numbers to them; and the courſe is even therewith at the ſide, and the diſtance at the top and bottom: but if the given difference of latitude and departure cannot be found nearly, take $\frac{1}{2}$, $\frac{1}{3}$, &c. part, or any equal multiple of them that can be found; then the courſe is even with them at the ſide, and ſuch a part of the diſtance, as was taken of the difference of latitude and departure, at the top and bottom.

Example. 1. Given the difference of latitude 59 miles S, and the departure 68 miles W; the courſe and diſtance are required.

In the double column over 9, even with 49° at the right-hand ſide, is found together the given difference of latitude and departure; therefore the courſe is 49° S W, and the diſtance 90 miles

Example 2. Given the difference of latitudes 30 miles N, and the departure 18 miles E; the courſe and diſtance are required.

Here the given difference of latitudes and departure, or any numbers near them, are not to be found together in the table, therefore taking $\frac{1}{3}$ or the double of each, the courſe is found to be 31° N E, and the diſtance 35 miles.

Note. A table computed to every mile in the diſtance up to a 100 miles, would more readily ſolve this example.

Prop. IV. *Having the departure and middle latitude; to find the difference of longitude, according to the method uſed by* W. Jones, *Eſq;* F.R.S.

Seek the given departure, or the next leſs number in the columns ſigned lat. even with the given middle latitude found among the courſes, and at the top and bottom (ſigned diſt.) is the difference of longitude ſought; which if not found directly at once, may be taken out at twice or thrice.

Example 1. Being yeſterday noon in the latitude of 37° 17′ N, and this day noon in 38° 43′ N, and by the table the departure is found 70·921 E; the difference of longitude is required.

In the column ſigned lat. under 9, even with 38°, the middle latitude, is found 7·0921; therefore 90 miles is the difference of longitude ſought.

Example 2. Being yeſterday noon in latitude 46° 25′ N, and this day at noon in 47° 35′ N, ſo that the middle latitude is 47° N, and the departure is found 112·53 miles W; required the difference of longitude?

In the column ſigned lat. over 10 at the bottom, even with 47° at the

right-hand ſide, is 6·8290; therefore ſubducting 68·200 from 112·53, the remainder is 44·33; then over 6 is 4·0920, and 40·92 ſubducted from 44·33 leaves 3·41, which is found over 5; wherefore the difference of longitude is 165 miles weſt.

If the middle latitude be not an even degree, but have odd minutes; find the difference of longitude, for the even degrees next leſs and greater, and add a proportional part of the difference between the two reſults to the leſſer; the ſum will be the difference of longitude ſought.

Suppoſe the middle latitude in the laſt example had been 47° 20′ N; then after finding the difference of longitude as before for 47°, find it alſo for 48°, which is 168 miles; then $\frac{1}{3}$ of the difference being added to the former, gives the difference of longitude 166 miles weſt.

Note. Though this method is not in all caſes near the truth, yet when the miles are geographical, it is ſufficiently near for daily practice in any voyage, as well as eaſy, and very expeditious.

Prop. V. *Having the latitudes and longitudes of two places, to find the bearing and diſtance.*

Seek the complement of the middle latitude among the degrees, and the difference of longitude in minutes among the diſtances, the departure anſwering is found in its proper column; then with the difference of latitudes and departure, find their bearing or courſe and diſtance by the third.

Example. Let the Lizard be given in the latitude of 49° 50′ N, and 5° 21 W longitude, and cape Ortegal in the latitude of 44° 10′ N, and 70° 43′ W longitude; to find the bearing and diſtance.

The difference of longitude is 142′; and in the columns ſigned dep. under 10, 4, and 2, even with 43° the comiddle latitude, are found 6·8200, 2·7280, and 1·3640; then increaſing the two former as before ſhewn, their ſum is 96·844 miles W, for the departure; and the bearing, or courſe, anſwering to 340 miles difference of latitude, with 96·844 departure, is found about 16° S W; and the diſtance about 354 miles.

OF MERCATOR'S SAILING.

THE uſes of the table of meridional parts are fully ſupplied by the table of logarithmic tangents, as is demonſtrated in N° 219 of the Philoſophical Tranſactions. It is there proved, 1ſt. That the meridional line, or ſcale of Mercator's Chart, is a ſcale of the log. tangents of the half complements of the latitudes. 2dly. That ſuch log. tangents of Mr. Briggs's form, are a ſcale of the differences of longitude, upon the rumb which makes an angle of 51° 38′ 9″ with the meridian, And 3dly. That the differences of longitude, on different rumbs, are to one another as the tangents of the angles of thoſe rumbs with the meridian.

Hence it follows, that the difference of the log. tangents of the half complements of the latitudes, is to the difference of longitude a ſhip makes in ſailing on any rumb from the one latitude to the other, as the tangent of 51° 38′ 9″ (whoſe logarithm is 10·1015104) to the tangent of the angle of the rumb or courſe with the meridian; ſo that:

I. If two latitudes, and the difference of longitude be given, the courſe and diſtance are readily determined by this rule.

Take

Take, by help of the tables, the difference of the log. tangents of the half complements of the latitudes, eſteeming the laſt three figures to be a decimal fraction; and add the complement of its logarithm to the logarithm of the difference of longitude reduced to minutes, and the conſtant log. 10·1015104; the ſum (abating radius) ſhall be the log. tangent of the courſe. And to the log. ſecant of the courſe, add the logarithm of the difference of latitude reduced to minutes, the ſum (abating radius) ſhall be the logarithm of the diſtance in minutes.

Example. Given the Lizard to be in latitude 49° 55′ N, Barbadoes in 13° 10′ N, and their difference of longitude 53° 00′, or 3180′ W; to find the courſe and diſtance.

½ Co lat.	Barbadoes	38° 25′	l. tan.	9·8993082	l. 3180′ =	3·5024271
	Lizard	20 2½	l. tan.	9·5620477	conſt. log.	10·1015104
			diff.	3372·605	its co. log.	6·4720346
Log. tang. of the courſe 49° 59′ 10″ SW						10·0759721
Log. ſec. of the courſe 49 59 10						10·1918067
Log. of 2205′ diff. of the latitudes						3·3434086
Log. of 3429·378 diſtance of Barbadoes from the Lizard . .						3·5352153

II. If two latitudes and the courſe be given, the difference of longitude is obtained with the ſame eaſe: for as the tangent of 51° 38′ 9″ is to the tangent of the courſe, ſo is the difference of the log. tangents of the half complements of the latitudes, to the difference of longitude ſought. Wherefore to the complement of the conſtant log. 10·1015104, add the log. of the difference of the log. tangents of the half complements of the latitudes, and the log. tangent of the courſe, the ſum (abating radius) will be the log. of the difference of longitude in minutes.

Example. Given the latitudes 49° 55′ and 13° 10′, and courſe 49° 59′ 10″, to find the difference of longitude.

Lat. 13° 10′, its ½ co lat.	38° 25′	l. tan.	9·8993082		
Lat. 49 55 . . .	20 2½	l. tan.	9·5620477	co. conſt. log.	9·8984896
		diff.	3372·605	its log.	3·5279654
Log. tang. of the courſe 49° 59′ 10″					10·0759721
Log. of 3180′ = 53° for diff. of longitude					3·5024271

By this rule, having two good obſervations of the latitude, and the courſe duly ſteered, the reckoning of a ſhip's way is beſt aſcertained, eſpecially if you ſail near the meridian.

III. If the latitude departed from, the courſe ſteered, and diſtance ſailed, be given; to find the ſhip's latitude, and difference of longitude.

Firſt, the latitude is obtained from the conſideration that the diſtance is to the difference of latitude, as radius to the coſine of the courſe, which is common to plain ſailing. Therefore to the log. of the diſtance add the log. coſine of the courſe, the ſum (abating radius) is the log. of the difference of latitudes; which difference added to the leſſer latitude, or ſubtracted from the greater, the ſum or remainder is the preſent latitude: then having the two latitudes, and the courſe, the difference of longitude is found by the ſecond.

Example.

Example. Having ſailed from the Lizard, in lat. 49° 55′ N, on a courſe 49° 59′ 10″ ſouth-weſterly 3429·378 miles: required what longitude and latitude the ſhip is found in.

Log. of 3429·378 the diſtance ſailed . . . . . 3·5352153
Log. coſine of 49° 59′ 10″ the courſe . . . . . 9·8081933
Log. of 2205′, or 36° 45′ diff. of the latitudes . . . . . 3·3434086
Now ſubtracting 36° 45′ from 49° 55′, the remainder 13° 10′ N. is the latitude the ſhip is found in.

By which latitude, now known, the difference of log. tangents will be found 3372·605, and the further proceſs in nothing differing from the ſecond rule, whereby the difference of longitude will be found 53° 00′.

Thus the dead reckoning by the log. line, and daily account of a ſhip's way, are duly kept, and the trouble very little more than by plain ſailing.

Theſe are all the caſes that occur in practice; the reſt, that are moſtly ſpeculative, are either eaſily reducible to theſe, or elſe not to be performed by logarithms, and therefore come not at preſent under our cognizance.

But it is to be noted, that both the complements of the latitudes are to be eſtimated from the ſame pole of the world; which may be from either; and therefore if one latitude be N, and the other S, to have their complements, you muſt add 90° to one of them, and ſubtract the other from 90, and then the operation will be the ſame as in the preceding caſes.

Example. Given St. Jago, one of the Cape de Verd iſlands, in the latitude of 14° 56′ N; and the iſland St. Helena, in latitude 15° 45′ S, and their difference of longitude 30° 12′ E; to find the courſe and diſtance.

½Co lat. { St. Jago 52° 28′ . l. tan. 10·1144965 l. 1812′ 3·2581582
St. Helena 37 7½ . l. tan. 9·8790845 conſt. log 10·1015104
2354·120 its co. log. 6·6281714
Log. tang. of the courſe 44° 11′ 53″ SE . . . 9·9878400
Log. ſec. of the courſe 44 11 53 . . . . . 10·1445200
Log. of 1841′ diff. of the latitudes . . . . . 3·2650538
Log. of 2567·875 diſtance of St. Helena from St. Jago . 3·4095738

Or if it be thought eaſier, when one latitude is N, and the other S, you may add 90° to each of them, the ſum of the log. tangents of their halves (abating twice the radius) will be the ſame as the difference of the log. tangents of the former. For an example take the ſame latitudes as in the preceding.

Then 90° + { 14° 56′ = 104° 56′ } its half { 52° 28′ l. tan. 10·1144965
15 45 = 105 45 } { 52 52½ l. tan. 10·1209155
The ſum (abating twice the radius) equal to the former diſtance 2354·120

Alſo when both latitudes are of the ſame name, that is both N or both S, you may add 90° to each of them, the difference of the log. tangents of half theſe ſums, will be the ſame as of the log. tangents of half the complements of thoſe latitudes.

OF

OF THE TABLE FOR THE LENGHTS OF CIRCULAR ARCS.

THIS is table 12, and conſtitutes page 340. It contains the lengths of every ſingle degree up to 189, and of every minute, ſecond, and third, each up to 60. The form of it is obvious, the length of each degree, minute, ſecond, or third, immediately following it on the ſame line in the next column. And the two following examples will ſhew the uſe of the table.

Ex. 1. To find the length of an arc of $57^\circ\ 17'\ 44''\ 48'''$.

Take out from their reſpective columns the lengths anſwering to each of theſe numbers ſingly, and add them all together, thus;

57° . . .	0·9948377
$17'$	49451
$44''$	2133
$48'''$	39
the ſum or	1·0000000 is the whole length, and is equal to the radius.

Ex. 2. To find the degrees, minutes, &c. in the arc 1, which is equal to the radius.

Subtract from it the next leſs tabular arc, and from the remainder the next leſs again, and ſo on till nothing remain; and oppoſite the ſeveral numbers ſubtracted, will be the degrees, minutes, &c. thus:

Given length	1·0000000
57°	0·9948377
	51623
$17'$	49451
	2172
$44''$	2133
$48'''$	39

So that the arc equal to the radius contains $57^\circ\ 17'\ 44''\ 48'''$

OF

OF THE TABLE FOR COMPAIRING THE COMMON AND HYPERBOLIC LOGARITMS.

THIS is table 13, and is the upper part of page 341. It contains the hyperbolic logs. anſwering to the firſt 100 common logs. and is very uſeful for ſpeedily changing the one into the other.

Ex. 1. To find the hyp. log. anſwering to the common log. 0·9542425.

Beginning at the left hand, and dividing the given number into periods of two figures each, including the index, take out the hyp. log. to each period, omitting 2 figures at the 2d period, four at the 3d, and 6 at the 4th: then add them all together, thus:

com. log.	hyp. log.	
09 . . .	2·0723266	
54 . . .	1243396	
24 . .	5526	
25 . .	58	
0·9542425	2·1972246	anſw.

Ex. 2 To find the common log. anſwering to the hyp. log. 2·1972246.

Subtract continually each next leſs tabular hyp. log. from the given number, and from the remainders; and the ſeveral common logarithms anſwering to theſe tabular hyp. logs. joined together, will be the com. log. reqd. thus:

	hyp. log.
given	2·1972246
09 . . .	2·0723226
	1248980
54 . . .	1243396
	5584
24 . . .	5526
	58
25 . . .	58

0·9542425 anſw.

The remaining pages contain the ſmall table of the names and degrees, &c. in the points of the compaſs, which needs no illuſtration; and a copious liſt of ſuch errors, with their corrections, as have been diſcovered in the principal books of logarithms; among which are many that have been detected by myſelf, both in the Avignon edition of Gardiner, and in Gardiner's own quarto edition, which renders this liſt more compleat than any former one, and it will be found very uſeful in correcting thoſe books of tables which are already in the poſſeſſion of the public. As to all the editions of Sherwin's tables in octavo, the errors in them, amounting to many thouſands, are far too numerous to be printed in this work.

TABLE I.

CONTAINING THE

LOGARITHMS

OF ALL NUMBERS,

From 1 to 100,000.

N.	Log.	N.	Log.	N.	Log.	N.	Log.	N.	Log.

L. to 20 places, 916.			96189

Expl. & Uſe. pa. 11, l. 4 bot. $m^{\frac{1}{y}}, m^{\frac{r}{y}}$.

Note, that ſome very few places are omitted where a figure does not perfectly appear, as they are not real errors, and cannot miſlead, but may eaſily be filled up by the differences.—It is alſo to be obſerved that, ſome of theſe errors in both the books, are not in all copies of the ſame edition, as I have experienced by collating divers copies: a circumſtance probably occaſioned by types ſometimes working out at the preſs, and careleſsly ſupplied again; and ſometimes by diſcovering and correcting errors after the copies of ſome ſheets have been but partly worked off.—All the real errors in both books are brought together in theſe tables, both thoſe I have ſeen printed elſewhere, and thoſe received by private communication, beſides upwards of twenty detected by myſelf, in comparing the proofs of my book with the like parts of the others.
